SUNON

Magnetic Levitation System Fan (MS)

Fan Motor Domination

A Stunning New Tech From SUNON~ Magnetic Levitation System MS!
Noise-Free, Vibration-Free, Super Long Life

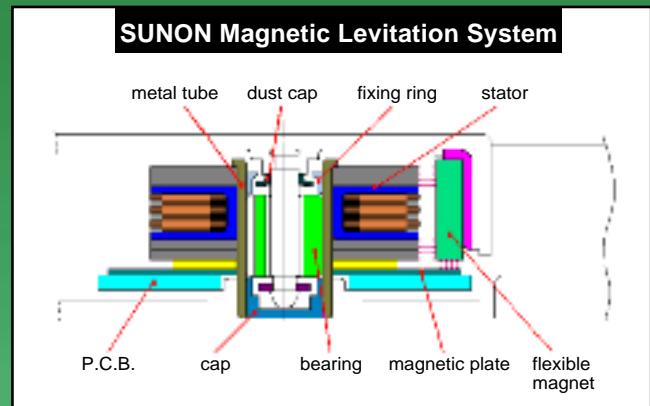

Sunon has recently introduced its latest innovation called Magnetic Levitation System (MS) and soon causes great impact on motor field. MS design can collocate with all kinds of traditional motors using with sleeve bearing or ball bearing, helping fan motors creating an unprecedented vibration-free, noise-free operation environment, which is in urgent necessity for thermal management of PC and IT industry.

The principle of SUNON MS design comes from the utilizing of magnetic force induced by the existing magnet inside the hub and the magnetic plate added to the PCB of the fan. When the fan is operating, the perfectly balanced rotor assembly would rotate in nearly perfect circular motion in a consistent orbit and the center of rotation of the rotor shaft would be the true centerline of the shaft and the bearing assembly.

This phenomenon eliminates any rotational vibration and rubs between the shaft and the inner surface of the bearing in any resting position. Accordingly, this MS design creates unprecedented vibration-free and therefore noise-free operation condition for the fan.

For traditional fan motors, with either sleeve or ball bearing, in addition to their known advantages and disadvantages, there are some shortcomings as shown in the following table :

	Deficiency of Traditional Motors	SUNON MS Solution MS+ Vapo Bearing
Sleeve Bearing	<ul style="list-style-type: none"> ■ Weight of rotor is entirely loaded to the shaft, abrasive rotation between shaft and bearing will result in irregular and rough surface on inner surface of bearing bore. The fan motor rotation becomes not smooth and in return causes operation noise and shortens fan life. ■ The oil ring and mylar washer not only create excess friction area but also prevent the high temperature gas evaporated from the lubricating oil from escaping to outside the fan assembly. Such gas if is not released appropriately before being solidified, would become nitride particles and rest in the gap between shaft and bearing bore. This causes the rotor stuck and induces excessive noise. 	<ul style="list-style-type: none"> ■ Entire weight of rotor assembly is totally neutralized by magnetic force in any rest position, keeping motor rotates evenly at a fixed center line and keeps a consistent distance from inner surface of bearing. No traditional rubs and noise occurred. ■ Oil ring, washer, and lubricant for bearing assembly are no longer used in MS structure. Hence no more oil leakage or rotor stuck problem. ■ MS design allows the fan operates in temperature higher than 70°C.
Ball Bearing	<ul style="list-style-type: none"> ■ When fan motor is operating, the steel balls inside generate higher rotational noise than that of sleeve bearing ■ Construction of Ball bearing is quite weak and unable to absorb external impact and/or vibration therefore would easily be damaged and result in louder rotational noise. 	

Because of so many not-easy-to-resolve disadvantages in traditional fan motors, Sunon took the challenge and has devoted many years in research and development on new motor structure for eliminating such disadvantages. As a result, MS design, the most revolutionary technology, once again wins Sunon's reputation.

What Makes MS Magic

When the motor with the MS technology is in operation, magnetic force between the permanent magnet in the hub and the magnetic plate mounted on the PCB helps to attract the impeller rotor towards the end point of shaft. The weight of the rotor is entirely neutralized by the magnetic force and enables the shaft turning without being affected by the gravitational force due to the dead weight of the rotor assembly, pivotally held in the bearing. In this way, a constant distance between bearing and shaft is maintained naturally without causing any contacts between the two surfaces.

Because the shaft rotates evenly in a constant orbit and the rotor is held at fixed center line of rotation, no matter what the position is, during the operation of fan, there is no friction or noise created, and no slanting and wobbling happened, which means the bearing life is extended much longer.

In addition for sleeve and ball bearings, MS also works well with Sunon's another own invention, the Vapo bearing, which features its specially treated inner surface to resist abrasions. With the combination of the MS design and Vapo bearing, all the advantages of ball and sleeve bearings are maintained but defects eradicated. In addition, Sunon's Vapo bearing with MS is capable of operating at temperature even higher than 70°C.

SUNON Magnetic Levitation System(MS)

*Specifications subject to change without notice

Standard DC Brushless Fan Model Numbering System

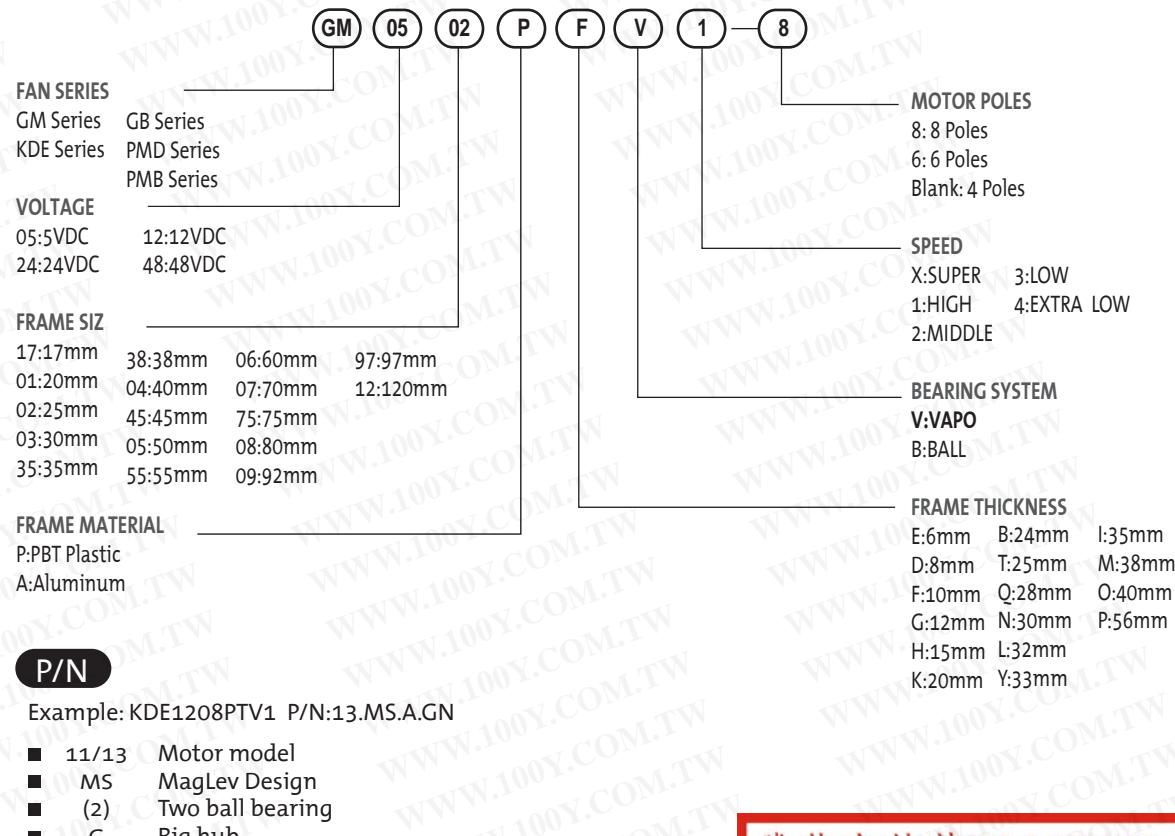

Example: KD1205PFB1 P/N:H.G

- 11/13 Motor model
- (2) Two ball bearing
- H Component/process upgraded
- OC Low voltage start-up & open collector type
- G Big hub
- V New blade
- BXX Special circuit design
- CXX Different dimensions, particular process or supplementary component parts
- M 3rd wire square wave signal was not amplified
3rd wire square with open collector type (only available for P/N: H&MS Series)
- TM 3rd wire square with open collector type
- R 3rd wire with rotation detector waveform(Only available for 8025/9225/12025/12038 Series)
- F 3rd wire with frequency generation waveform(Only available for 8025/9225/12025/12038 Serie)
