

BETA Low-Voltage Circuit Protection

19

19/2 Introduction

Miniature Circuit Breakers

- 19/4 High-capacity range
- 19/19 Comfort range with plug-in terminal
- 19/21 Compact range 1 + N in 1 MW
- 19/22 Additional components
- 19/29 Busbars
- 19/33 Universal range according to UL and IEC
- 19/36 Main miniature circuit breakers, SHU
- 19/37 Circuit breaker terminals

Residual Current Protective Devices

- 19/39 RCCBs, type A
- 19/43 SQUENCE, type B
- 19/46 Additional components
- 19/48 RC units, type A
- 19/51 RCBOs, type A
- 19/55 Busbars
- 19/57 Accessories

Low-Voltage Fuse Systems

- 19/58 NEOZED fuse systems
- 19/65 DIAZED fuse systems
- 19/71 Cylindrical fuse systems
- 19/74 Class CC fuse systems
- 19/76 Busbars for fuse systems
- 19/80 LV HRC fuse links
- 19/89 LV HRC signal detectors
- 19/91 LV HRC fuse bases
- 19/97 LV HRC fuse switch disconnectors

SITOR Semiconductor Fuses

- 19/113 SITOR, LV HRC design
- 19/120 SITOR, cylindrical fuse design
- 19/123 SILIZED, NEOZED and DIAZED design

SR60 Busbar Systems

- 19/124 Distribution board components
- 19/129 Built-in components
- 19/133 Mounting components

Overvoltage Protection Devices

- 19/135 Lightning arresters, type 1
- 19/136 Combination surge arresters, type 1 and type 2
- 19/137 Surge arresters, type 2
- 19/139 Surge arresters, type 3
- 19/140 Accessories for surge arresters
- 19/141 Overvoltage protection adapters

Socket Outlets

- 19/142 Socket outlets

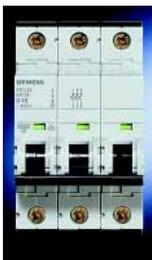

Three-Phase Measuring Devices

- 19/145 Multimeters
- 19/147 Multicounters
- 19/150 LAN couplers
- 19/152 E-counters
- 19/154 E-counters *instabus* KNX EIB
- 19/155 Current transformers
- 19/156 Measuring selector switches

Single-Phase Measuring Devices

- 19/157 E-counters
- 19/157 Digital measuring devices
- 19/158 Analog measuring devices
- 19/159 Time and pulse counters
- 19/160 Time counters for front-panel mounting

Note:
 More devices from the
 BETA low-voltage protection equip-
 ment range can be found in the Cata-
 log ET B1 2008.

Operational classes	aR, gR, gS	aR	gR
Rated voltage	V AC 500 ... 2500 V DC 700	600/690 400/700	400/500 250/500
Rated current range	A 16 ... 1600	1 ... 100	10 ... 100

Distribution board
components
8GK, 8JH, 8JK, 8US

Built-in components
5SF, 5SG, 5SH

Mounting components
5SH, 8US

Socket outlets
5TE6

BETA SR60 busbar systems

Application	Busbars, busbar supports and covers	NEOZED/DIAZED bus-mounting bases, NEOZED bus-mounting switch disconnectors	Bottom troughs, reserve section covers, cover profiles	BETA socket outlets
				Power supply for maintenance of distribution boards

E-counters
7KT1 140

Digital measuring
devices
7KT1 110, 7KT1 120

Analog measuring devices
7KT1 0

Time and
pulse counters
7KT5 8

Time counters for
front mounting
7KT1 50, 7KT1 60

BETA single-phase measuring devices

Application	Measuring of kWh in single-phase networks	Measuring of voltages and currents with large three-digit LED displays	Measuring of voltages and currents for monitoring input and output currents	For monitoring operating hours and starting operations for planning preventative maintenance tasks and preventing sudden shutdowns	For monitoring operating hours and starting operations for planning preventative maintenance tasks and preventing sudden shutdowns

High-capacity range

Overview

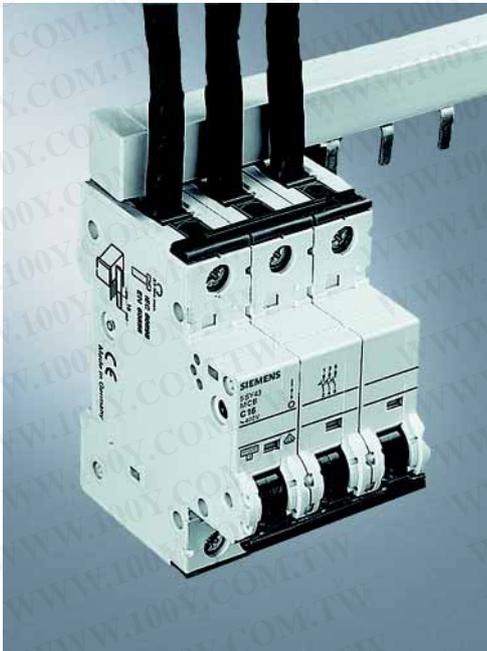

MCBs are used to protect plants in buildings and for industrial applications. The devices can be used as main switches for the disconnection or isolation of plants.

For industrial applications and in plant engineering, miniature circuit breakers can be supplemented with additional components, such as auxiliary switches, fault signal contacts, shunt trips, undervoltage releases and RC units.

The devices are approved for worldwide use according to IEC standards for systems up to 250/440 V AC. 60 V DC per pole is permitted in DC systems.

For North America, we also have additional approval to UL 1077 for use as "supplementary protectors" in systems up to 277/480 V AC. For use in ship building, the devices also have numerous certifications according to shipping classifications; BV, DNV, GL and LRS. For more details see Catalog ET B1 2008, Chapter "Miniature Circuit Breakers, Configuration".

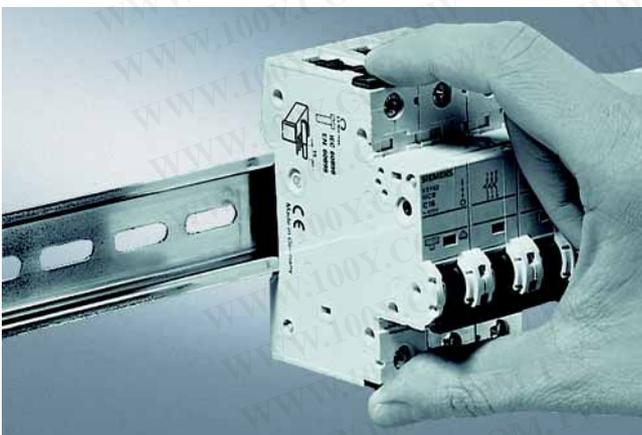

Benefits

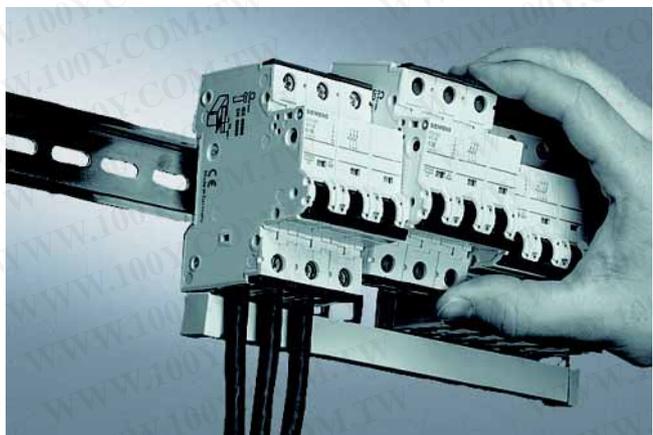

- The infeed can be either from the top or the bottom as the terminals are identical
- Clear and visible conductor connection that can be easily checked in front of the busbar.
- Large and easily accessible wiring space enables easy insertion of conductor in the terminal.

- Integrated movable terminal covers located at the cable entries ensure the terminals are fully insulated when the screws are tightened
- The effective touch protection when grasping the device considerably exceeds the requirements of VBG 4/BGV A3.

- Manual snap-on fixing and release systems that require no tools enable fast assembly and disassembly of MCBs.

- The MCBs can be quickly and easily removed from the busbar assembly by hand if connections need to be changed.
- Time saving if parts need to be replaced because the busbars no longer need to be freed from the adjacent miniature circuit breakers.

BETA Protecting Miniature Circuit Breakers

Compact range 1 + N in 1 MW

Overview

These miniature circuit breakers are used for the protection of plants with switched neutral conductors in distribution boards with little space. They are only a single modular width.

Compact busbars facilitate installation in space saving distribution boards.

The devices are approved for worldwide use according to IEC standards for systems up to 250 V AC. 60 V DC per pole is permitted in DC systems according to IEC standards.

Benefits

- Auxiliary switches and fault signal contacts from the high-capacity range can be freely mounted on these devices. This increases availability and cuts down on logistics
- The devices have the same design as the high-capacity program and ensure a uniform appearance in the distribution board
- The miniature circuit breakers can be quickly and easily removed from the assembly by hand if connections need to be changed
- Time saving if parts need to be replaced because the busbars no longer need to be freed from the adjacent miniature circuit breakers.

Additional components

Overview

Using this mounting concept, all additional 5ST3 components can be combined with miniature circuit breakers of the 5SY and 5SP4 series.

The auxiliary switch (AS) signals the contact position. In the event of a fault, the fault signal contact (FC) signals the automatic tripping of the miniature circuit breaker and the contact position.

Undervoltage releases are integrated in an EMERGENCY-STOP loop, thus ensuring that the miniature circuit breaker trips in the event of an emergency, which in turn ensures disconnection of the control circuit according to EN 60204. In the event that the voltage is interrupted or too low, it also trips, i.e. prevents the miniature circuit breaker from switching on.

Shunt trips are used for the remote tripping of miniature circuit breakers.

Remote-controlled operating mechanisms are used for the remote ON/OFF switching of miniature circuit breakers and the remote ON switching of RC units. Remote-controlled operating mechanisms also enable local manual switching. A blocking function permits maintenance work. In the event that a miniature circuit breaker or RC unit is tripped, an acknowledgment must be carried out prior to switching back on.

For further information on RC units, please refer to the section "Residual current protective devices".

Benefits

- Bus systems, such as *instabus* KNX *EIB*, AS-Interface bus or PROFIBUS, are integrated in the communication over binary inputs and actuators.
- Captive metal brackets on the additional components ensure fast mounting on the devices.

Auxiliary switches (AS)

- Huge range of applications, thanks to additional versions for the switching of small currents and voltages for the control of programmable control systems (PLCs) acc. to EN 61131-2.

Remote-controlled operating mechanisms (RC)

- The remote-controlled operating mechanism has an operating mode selector switch with the functions: "Locked", "Manual" and "Remote switching". The mechanism can be mechanically latched and locked, which serves to protect personnel during maintenance work.

Additional components

More information

Using this mounting concept, all additional 5ST3 components can be combined with miniature circuit breakers of the 5SY and 5SP4 series. However, no RC unit on 5SY5. The 5SY6 0.. miniature circuit breakers are only designed for the mounting of auxiliary

switches, fault signal contacts and remote-controlled operating mechanisms. The graphic shows which additional components can be mounted on either the right or the left.

Overview

The busbar system with pin-type terminals can be used for all 5SJ6 and 5SY miniature circuit breakers with or without mounted auxiliary switch (AS) or fault signal contact (FC).

Busbars in 10 mm² and 16 mm² versions are available.

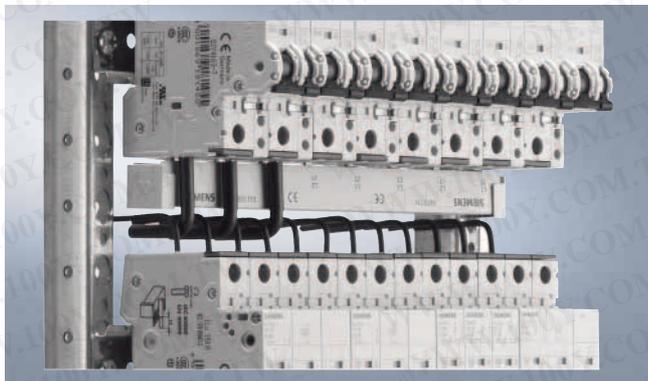

The extremely flexible 5ST3 6 busbar system with fixed lengths enables installation in any length as the busbars can be overlapped.

No further need for time-consuming tasks, such as cutting, cutting to length, deburring, cleaning of cut surfaces and mounting of end caps.

Any free pins on the busbars can be made finger-safe by covering with touch protection.

For further information on bus-mounting miniature circuit breakers with residual current operated circuit breakers, please refer to the section "Residual current protective devices".

Benefits

- Between the devices, the busbar, located at the bottom and behind the conductor, provides an optimum wiring space with easy view of the inserted conductor. This enables easy control of connections.

- The ability to overlap the busbar mounting enables a cross-section enlargement of up to 32 mm² using the respective components, 10 and 16 mm².

- The fact that the connection of the conductor is always clearly visible facilitates control and insertion of conductors of all pole types and considerably reduces mounting times.

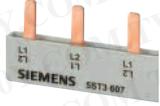

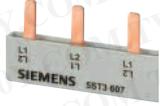

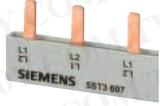

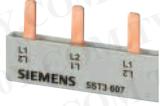

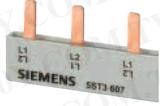

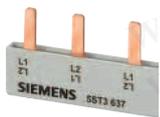

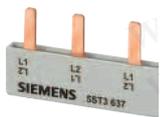

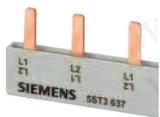

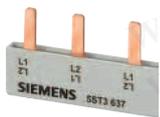

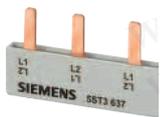

- The fact that the connection of the conductor is always clearly visible facilitates control and insertion of conductors of all pole types and considerably reduces mounting times.

BETA Protecting Miniature Circuit Breakers

Universal range according to UL and IEC

Overview

Miniature circuit breakers to EN/IEC 60898 of European design are not approved for general use in the USA. For general use, these devices are certified to UL 489, which permits use as an all-round solution for protection tasks in distribution boards, control cabinets and control systems to UL 508 A as "branch protectors" within the sphere of influence of the ANSI (American National Standards Institute).

The terminals are suitable for "field wiring". This means that devices can be installed not only in a workshop, but also on-site at the customer.

The 5SY4 ...-HG40 version is approved for "same polarity" and 5SJ4 ...-HG41 is also approved for "opposite polarity".

The devices are designed according to UL 489 for a rated voltage of 240 V AC and 60 V DC. This covers all applications in control engineering and the residential market.

Benefits

- Available for all applications in residential, non-residential and industrial buildings. This facilitates the planning of plants and enhances export opportunities.
- The devices can also be used in compliance with IEC/EN 60898 in systems up to 250/440 V AC. Which means these devices can be installed anywhere in the world.

Overview

Selective main miniature circuit breakers are used as circuit breakers at meter panels or as group miniature circuit breakers in distribution board applications.

Characteristic E is adapted to the special application requirements for cascade circuits between melting fuses and miniature circuit breakers.

The devices can be screwed onto a mounting plate or attached to a 40 mm busbar by means of an adapter.

Using a mounting plate, they can be mounted on a standard mounting rail according to EN 60715.

Benefits

- Improved current limiting characteristics increases plant protection, thanks to the selective main miniature circuit breakers supporting downstream miniature circuit breakers.
- High and safe selectivity between sub-distribution and meter panel ensures the supply of the unaffected circuits in the event of a fault, thus improving plant availability.
- The selective main miniature circuit breaker prevents the affected circuit from being reconnected until the fault is eliminated. Greater safety during operation
- No previous knowledge required for operation of the selective main miniature circuit breakers. This ensures fast and safe disconnection and reconnection of loads.

BETA Protecting Miniature Circuit Breakers

Main miniature circuit breakers, SHU
Circuit breaker terminals

6 000 3	I_n	MW DT	Order No.	Price per PU	PG	PU (UNIT, SET, M)	PS*	Weight per P. unit approx kg
	A							
	Transparent operating protective covers Multiple locking options against accidental and intended operation							
		B	5ST1 323		005	1	3 units	0.012
								
	Terminal covers 2 units required per device; for covering terminals within the overall dimensions according to DIN 43880							
		B	5ST1 316		005	1	6 units	0.001

Overview

Circuit breaker terminals are used for short-circuit protection or for protection against overloading and short-circuiting in auxiliary and control circuits after control transformers.

All terminals are designed for 2 wires. The terminal block labeling accessories are used for inscription.

Benefits

- Integration of line protection switching function in the terminal technology of control cabinets in compact 12 mm design
- Display of switch position or the "Tripped" state for the fast detection of faults
- Switching/isolating function facilitates fault locating
- Device versions with integral auxiliary switch (AS) signal the contact position
- Device versions with floating through-type connection parallel to the switching contacts facilitate line connection.

BETA Protecting Residual Current Protective Devices

RCCBs, type A

Overview

RCCBs of type A are used in all systems up to 240/415 V AC. They trip in the event of both sinusoidal AC residual currents and pulsating DC residual currents.

RCCBs with a rated residual current of maximum 30 mA are used for personnel, material and fire protection, as well as for protection against direct contact. RCCBs with a rated residual current of 10 mA are primarily used in areas that represent an increased risk for personnel.

Since DIN VDE 0100-410 came into effect in June 2007, all socket outlet current circuits up to 20 A must now also be fitted with residual current protective devices with a rated residual current of max. 30 mA. This also applies to outdoor electrical circuits up to 32 A for the connection of portable equipment.

Devices with a rated residual current of maximum 300 mA are used as preventative fire protection in case of insulation faults. RCCBs with a rated residual current of 100 mA are primarily used outside Europe.

SIGRES

SIGRES RCCBs were developed for use in harsh ambient conditions, such as swimming baths as protection against chlorine and ozone, in the agricultural sector (ammonia), on building sites and in the chemical industry (nitrogen oxide, sulfur dioxide, solvents), in the food processing industry (hydrogen sulfide) and in unheated rooms (dampness). The patented active condensation protection requires the infeed from below with the RCCBs switched off.

Super resistant **K**

Super resistant (short-time delayed) RCCBs comply with the maximum permissible break times for instantaneous devices. However, by implementing a short-time delay they prevent unnecessary trippings, and thus plant faults, when pulse-shaped leakage currents occur - as is the case when capacitors are switched on.

Selective **S**

Selective RCCBs are used as upstream group switches for selective tripping as opposed to the downstream, instantaneous or super resistant RCCBs of type A. Selective RCCBs up to 300 mA are also used for preventative fire protection in the case of insulation faults. The dimensioning of the rated residual current depends on the size of the plant.

Benefits

- Instantaneous RCCBs with the N-connection on the left-hand side enable simple bus-mounting with standard pin busbars with MCBs installed on the right-hand side
- Instantaneous RCCBs with the N-connection on the right-hand side can be bus-mounted with MCBs using a special pin busbar
- Instantaneous devices have a surge current withstand capability with current waveform 8/20 μ s of more than 1 kA, super resistant of more than 3 kA and selective of more than 5 kA. This ensures safe operation
- SIGRES has an extremely long endurance due to patented active condensation protection and the same dimensions for fast and easy replacement of already installed instantaneous RCCBs
- Super resistant devices increase plant availability, as unnecessary tripping is prevented in systems with short-time voltage peaks
- Selective RCCBs increase plant availability, as in the event of a fault, a staggered tripping time enables the selective tripping of RCCBs connected in series
- Auxiliary switches or remote-controlled operating mechanisms are also available as additional components
- The operating handle and the test button can be locked by means of a handle locking device.

BETA Protecting Residual Current Protective Devices

SIQUENCE, type B

Overview

Frequency converters, medical devices and UPS systems are seeing increasing usage in industry. Smooth DC residual currents or currents with low residual ripple may occur in the event of faults on these devices.

Type A residual current protective devices are unable to detect these smooth DC residual currents. Furthermore, such smooth DC residual currents make Type A devices increasingly insensitive to AC residual currents and pulsating DC residual currents. Hence if a fault occurs, there is no tripping and the desired protection function is no longer assured.

Universal current-sensitive residual current protective devices of Type B have an additional transformer which is supplied with a control signal. Hence it is possible to evaluate the change of the transformer's operating range caused by smooth DC residual currents. The desired protection function is thus assured.

The devices in this series are designed as residual current operated circuit breakers (RCCBs) up to 80 A and as residual current circuit breakers with integral overcurrent protection (RCBOs) for 100 A or 125 A in Characteristics C or D.

Benefits

- Universal current-sensitive residual current protective devices detect not only AC residual currents and pulsating DC residual currents, but also smooth DC residual currents, thus ensuring the desired protection function with all types of residual current.
- The tripping characteristic is adapted to the increase of leakage currents at higher frequencies in systems with capacitive impedances and results in increased operating safety.
- The RCBO is a compact device for up to 125 A. It provides not only personnel, property and fire protection but also overload and short-circuit protection for cables. This enables great savings on wiring and installation costs.

More information

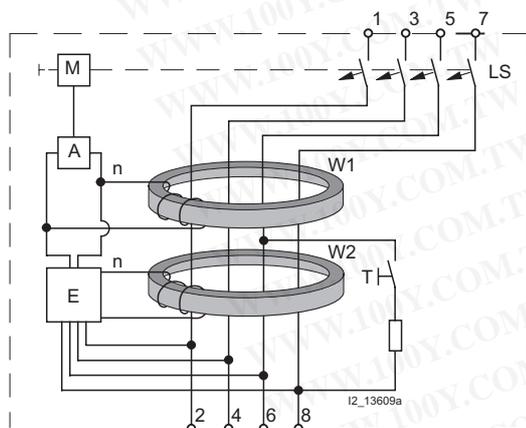

Device setup

Universal current-sensitive residual current protective devices are based on a pulse-current-sensitive circuit-protection device with tripping independent of line voltage, supplemented with an auxiliary unit for the detection of smooth DC residual currents. The diagrams below show the basic design.

The summation current transformer W1 monitors the electrical system for AC and pulse current-type residual currents. The summation current transformer W2 detects the smooth DC residual currents and, in the event of a fault, relays the tripping command through electronic unit E to release A, which uses the mechanics to disconnect the circuit.

Design of RCCBs

Design of RCBOs

- M Mechanics of the RCCB
- LS Miniature circuit breaker part
- A Release
- E Electronics for tripping in the event of smooth DC residual currents
- n Secondary winding
- W1 Summation current transformer for detection of sinusoidal residual currents
- W2 Summation current transformer for detection of smooth DC residual currents
- T Test button

Method of operation

The universal current-sensitive residual current protective devices work independent of the supply voltage compliant with current requirements in Germany for type A according to DIN VDE 0664-100.

A power supply is required solely for the detection of smooth DC residual currents by a second transformer. This is done from all system cables and is dimensioned so that the electronics still reliably trip even with a voltage reduction to 50 V.

This ensures tripping for smooth DC residual currents, as long as such residual current waveforms can occur, even in the event of faults in the electrical power supply, e.g. an N-conductor break. This means that the pulse-current-sensitive switch part, which trips regardless of line voltage, will still reliably trigger the tripping operation - even in the highly unlikely event that two phase conductors and the neutral conductor fail - if the remaining intact phase conductor presents a hazard.

The residual current protective devices of type B are suitable for use in three-phase current systems before input circuits with rectifiers. They are not intended for use in DC systems and in networks with operating frequencies other than 50 or 60 Hz.

RCBOs are a combination of RCCB and miniature circuit breaker for up to 125 A in a single compact device.

It thus provides not only personnel, property and fire protection but also overload and short-circuit protection for cables. The mechanics of the RCCB act on the tripping unit of the miniature circuit breaker, which disconnects the circuit.

Protective effect at high frequencies

In addition to the described residual current waveforms (AC residual currents, pulsating and smooth DC residual currents), AC residual currents with a wide range of frequencies may also occur on electronic equipment such as rectifiers in frequency converters or computer tomographs as well as at the outgoing terminal of a frequency converter.

Requirements for frequencies up to 2 kHz are defined in the device regulations DIN VDE 0664-100.

BETA Protecting Residual Current Protective Devices

SIQUENCE, type B

To date, only limited statements can be made with regard to the risk of ventricular fibrillations (up to 1 kHz) for frequencies higher than 100 Hz. No reliable statements can be made on any further effects of thermal or electrolytic influence on the human organism.

For this reason, protection against direct contact is only possible for frequencies up to 100 Hz.

For higher frequencies, protection against indirect contact must be implemented under consideration of the frequency response of the residual current protective device, the maximum permissible touch voltages up to 50 V and permissible grounding resistance derived from this information.

Versions

Super resistant **[K]**: short-time delayed tripping in the case of transient leakage currents.

High surge current withstand capability: > 3 kA.

Selective **[S]**: can be used as upstream group switch for selective tripping contrary to a downstream standard RCCB.

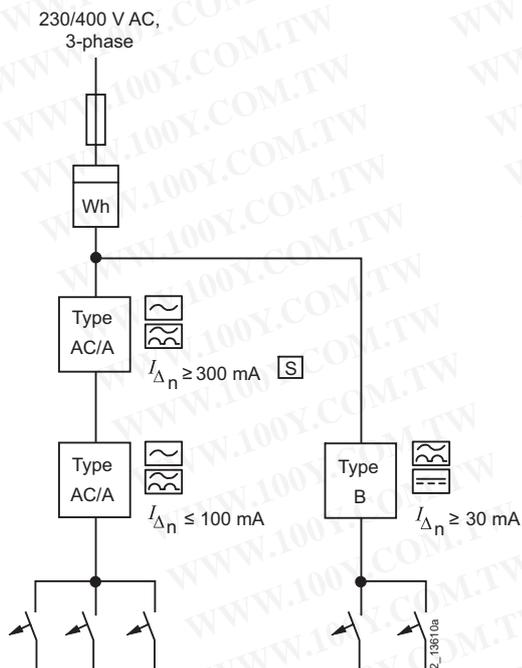

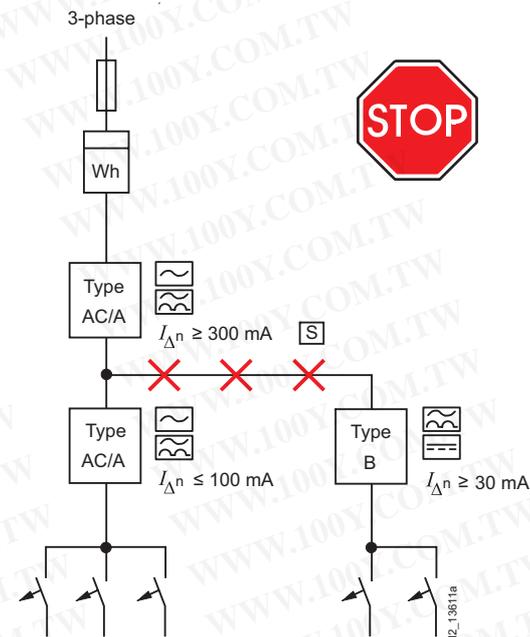

Configuration

DIN VDE 0100-530 "Selection of protective devices" also describes the configuration of systems with residual current protective devices.

EN 50178 (DIN VDE 0160) "Equipping power installations with electronic equipment" describes, among other things, how to select the type of residual current protective device suitable.

When configuring and installing electrical installations, electrical loads that can generate smooth DC residual currents in the event of a fault must be assigned a separate electrical circuit with a universal current-sensitive residual current protective device (type B).

It is not permitted to branch electrical circuits with these types of electrical loads after pulse-current-sensitive residual current protective devices (type A):

Additional components

Overview

Auxiliary switches (AS) signal the contact position of the RCCB.

Remote-controlled operating mechanisms are used for the remote ON/OFF switching of RCCBs. They also enable local manual switching. A blocking function permits maintenance work. If the RCCB is tripped, an acknowledgment must be carried out prior to switching back on.

The leakage current measurement unit detects the leakage currents - like the circuit breaker - thus providing a direct statement as to the current loading of the RCCB. It is used to measure leakage currents up to 300 mA. This requires a voltmeter with an internal resistance more than $1\text{ M}\Omega/\text{V}$ and a measuring range for AC voltages of $U_{\text{rms}} = 1\text{ mV}$ to 2 V. For the fault-free operation of an RCCB, the measured leakage current should be no greater than 1/3 of the rated residual current.

Benefits

- Using captive brackets, the remote-controlled operating mechanism can be attached (or retrofitted) to the right-hand side of the basic device without the need for tools
- Bus systems, such as *instabus* KNX EIB, AS-Interface bus or PROFIBUS, can be integrated in the communication over binary inputs
- The leakage current measurement unit enables the systematic selection of the rated residual current, thus preventing the inadvertent tripping of RCCBs.

BETA Protecting Residual Current Protective Devices

RC units, type A

Overview

RC units of type A can be used in all systems up to 240/415 V AC. They trip in the event of both sinusoidal AC fault currents and pulsating DC residual currents.

RCCBs with a rated residual current of maximum 30 mA are used for personnel, material and fire protection, as well as for protection against direct contact.

Devices with a rated residual current of maximum 300 mA are used as preventative fire protection in case of insulation faults.

RC units are combined with MCBs with characteristics A, B, C and D, provided that these are available in the MCB range. The two components are simply plugged together without the need for any tools.

They then form a combination of RCCB and MCB for personnel, fire and line protection.

Super resistant **K**

Super resistant (short-time delayed) RC units comply with the maximum permissible break times for instantaneous devices. However, by implementing a short-time delay they prevent unnecessary trippings, and thus plant faults, when pulse-shaped leakage currents occur – as is the case when capacitors are switched on.

Selective **S**

Selective RC units are used as upstream group switches for selective tripping as opposed to the downstream, instantaneous or super resistant residual current protective device of type A. Selective RC units up to 300 mA are also used as preventative fire protection against insulation faults.

The dimensioning of the rated residual current depends on the size of the plant.

Benefits

- Our wide variety of RC unit types and comprehensive range of miniature circuit breakers offer a huge spectrum of combinations for all applications
- All devices have surge current withstand capability of more than 1 kA, thus ensuring safe and reliable operation
- All additional components for miniature circuit breakers can be retrofitted on the right-hand side
- All 100 A and 125 A RC units offer external remote tripping over terminals Y1/Y2. This supports implementation of central OFF circuits
- Both components can be simply plugged into each other and secured with captive metal brackets - no tools required. This saves considerable time when mounting.

BETA Protecting Residual Current Protective Devices

RCBOs, type A

Overview

RCBOs are a combination of an RCCB and a miniature circuit breaker in a compact design for personnel, fire and line protection. For personnel and fire protection, the residual current part of the type A trips in the event of sinusoidal AC residual currents and pulsating DC residual currents.

RCBOs with a rated residual current of maximum 30 mA are used for personnel, material and fire protection, as well as for protection against direct contact. RCBOs with a rated residual current of 10 mA are primarily used in areas that represent an increased risk for personnel and the outdoor installations of residential buildings.

Devices with a rated residual current of maximum 300 mA are used as preventative fire protection in case of insulation faults.

The MCB part of the RCBO protects lines against overload and short-circuits and is available in characteristics B and C.

Since DIN VDE 0100-410 came into effect in June 2007, all socket outlet current circuits up to 20 A must now also be fitted with residual current protective devices with a rated residual current of max. 30 mA. This also applies to outdoor electrical circuits up to 32 A for the connection of portable equipment.

In order to implement this protection, we recommend the national use of RCBOs with 30 mA.

Assignment to each individual branch circuit, helps prevent the unwanted tripping of fault-free circuits induced by the accumulation of operation-related leakage currents or by transient current pulses during switching operations.

Additional components of the 5SY miniature circuit breakers can be mounted at the side and carry out additional functions.

For further details on additional components, please refer to the chapter "Miniature circuit breakers".

Benefits

For all versions

- Clear and visible conductor connection that can be easily checked in front of the busbar.
- Large and easily accessible wiring space enables easy insertion of conductor in the terminals.
- The surge current withstand capability of more than 1 kA ensures safe and reliable operation
- All additional components for miniature circuit breakers can be retrofitted on the right-hand side.

For all 10 kA versions up to 40 A

- Integrated movable terminal covers located at the cable entries ensure the terminals are fully insulated when the screws are tightened. The effective touch protection when grasping the device considerably exceeds the requirements of BGV A3.
- The RCBOs can be quickly and easily removed from the assembly by hand if connections need to be replaced. This saves time if parts need to be replaced because the busbars no longer need to be freed from the adjacent miniature circuit breakers.

For all 125 A versions

- The RCBOs offer external remote tripping over terminals Y1/Y2. This supports implementation of central OFF circuits.

BETA Protecting Residual Current Protective Devices

Busbars

Overview

4-pole 5SM3 RCCBs are bus-mounted either together or in combination with miniature circuit breakers. RCCBs with an N conductor connection on the left-hand side facilitate installation because normal busbars are used, as for miniature circuit breakers.

Busbars in 10 mm² and 16 mm² versions are available.

The extremely flexible 5ST3 6 busbar system with fixed lengths enables installation in any length as the busbars can be overlapped.

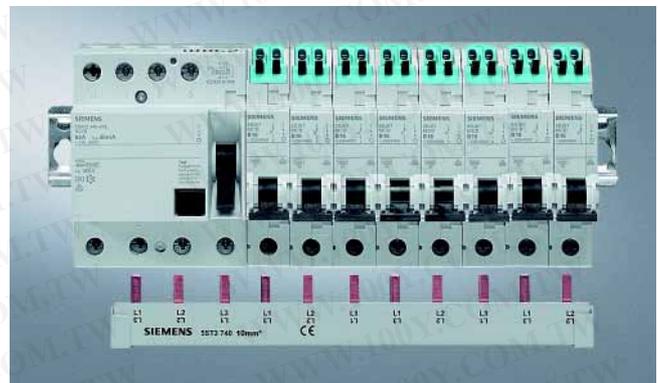

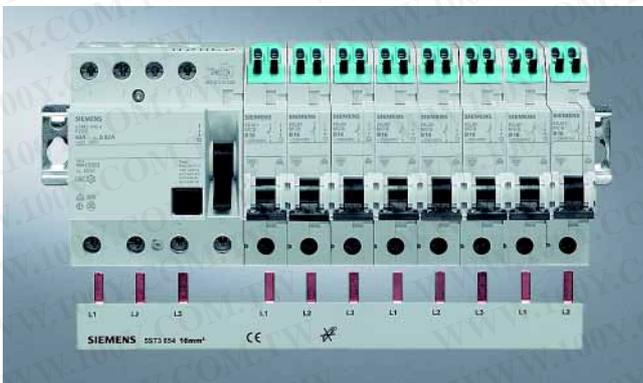

No further need for time-consuming tasks, such as cutting, cutting to length, deburring, cleaning of cut surfaces and mounting of end caps.

Any free pins on the busbars can be made finger-safe by covering with touch protection.

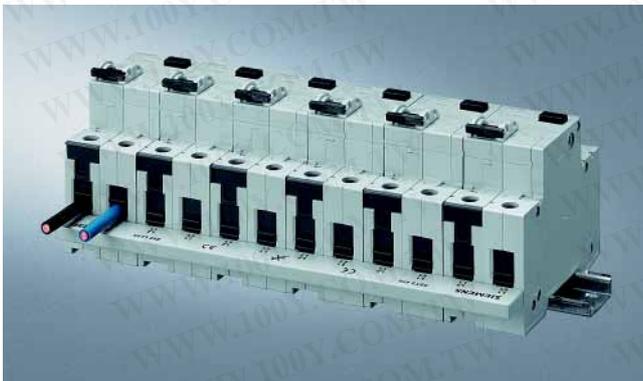

If several RCBOs are bus-mounted together, this is implemented with 2-phase busbars, which are used as 1+N busbars.

Benefits

- Connection of miniature circuit breakers to 4-pole RCCBs with N-connection right with 3-phase busbar, using busbar specially designed for this application. No cutting or end caps required.
- Connection of miniature circuit breakers to 4-pole RCCBs with N-connection left with 3-phase busbar that can be cut. No additional items to be stored and busbars that are always available.

- Connection of 1P+N RCBOs with 2-phase busbar. No cutting or end caps required.

- Bus-mounting of RCCBs on busbar (3-phase +N) that can be cut. A proven and frequently used application.

Overview

The NEOZED fuse system is primarily used in distribution technology and industrial switchgear assemblies. The system is easy to use and is also approved for domestic installation.

The MINIZED switch disconnectors are primarily used in switchgear assemblies and control engineering. They are approved for switching loads and for safe switching in the event of short-circuits. According to the recommendations of the VDEW, after the modifications to the TAB 2000 in 2006, the MINIZED D02 is also now suitable again for use in the precounter sector in household applications.

Due to its small footprint, the NEOZED disconnecter is primarily used in control engineering.

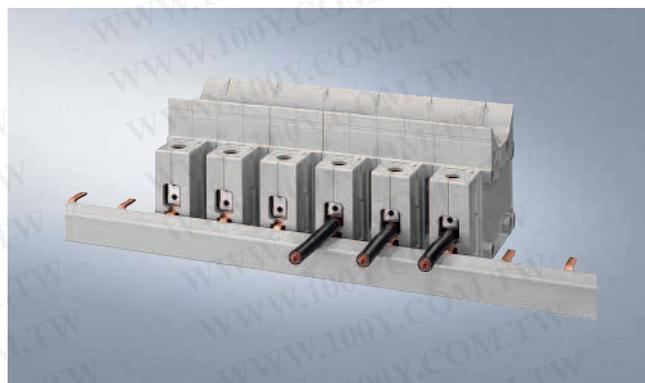

The NEOZED fuse bases are the most cost-effective solution for the application of NEOZED fuses. All NEOZED bases must be fed from the bottom to ensure that the threaded ring is insulated during removal of the fuse link. The terminals of the NEOZED bases are available in different versions and designs to support the various installation methods.

Benefits

MINIZED switch disconnectors

- Clear and visible conductor connection that can be easily checked. This facilitates cable entry and saves time
- With draw-out technology for no-voltage replacement of fuses. This provides enhanced safety
- The infeed of the devices can be from the top or the bottom. This enables flexible application.

NEOZED fuse bases made of molded plastic

- Clear and visible conductor connection that can be easily checked. This facilitates cable entry and saves time
- Greater safety for personnel thanks to terminals with touch protection acc. to BGV A3 at incoming and outgoing feeders. This ensures enhanced safety
- Two type ranges with different terminals offer expanded application options.

NEOZED fuse disconnectors

- With draw-out technology for no-voltage replacement of fuses. This provides enhanced safety
- Extremely narrow design with a single MW per pole. This saves space and costs.

NEOZED fuse bases made of ceramic

- Different terminal versions support a huge range of different installation methods. This increases flexibility
- These bases are the most widely used devices for applications with NEOZED fuses. An unrivaled cost-effective solution.

BETA Protecting Low-Voltage Fuse Systems

DIAZED fuse systems

Overview

The DIAZED fuse system is one of the oldest fuse systems in the world. It was developed by Siemens as far back as 1906. It is still the standard fuse system in many countries to this day. It is particularly widely used in the harsh environments of industrial applications.

The series is available with rated voltages from 500 to 750 V.

All DIAZED bases must be fed from the bottom to ensure an insulated threaded ring when the fuse link is being removed. Reliable contact of the fuse links is only ensured when used together with DIAZED screw adapters.

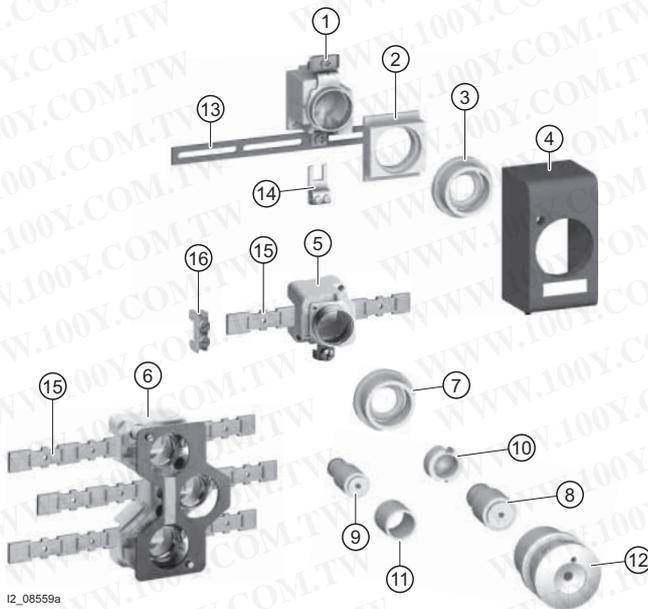

The terminals of the DIAZED bases are available in different versions and designs to support the various installation methods.

The high-performing EZR bus-mounting system for screw connection is an outstanding feature. The busbars, which are particularly suited for bus-mounting bases, have a load capacity of up to 150 A with lateral infeed.

DIAZED stands for **D**iametral gestuftes **z**weiteiliges Sicherungssystem mit **E**disongewinde (diametral two-step fuse system with Edison screw).

Benefits

DIAZED fuse systems are a result of the well-designed modular system, the components can be combined in any way to meet the various requirements and to facilitate different installation methods.

BETA Protecting Low-Voltage Fuse Systems

Cylindrical fuse systems

Overview

Cylindrical fuses are standard in Europe. There are different cylindrical fuse links and holders that comply with the standards IEC 60269-1, -2 and -3. They are suitable for operation in industrial applications. In South West Europe they are also approved for use in residential buildings.

The cylindrical fuse holders are also approved to UL 512. The cylindrical fuse holders are tested and approved as fuse disconnectors according to the switching device standard IEC 60947-3. They are not suitable for switching loads.

Cylindrical fuse holders can be supplied with or without signal detectors. In the case of devices with signal detector, a small electronic device with LED is located behind an inspection window in the plug-in module. If the inserted fuse link is tripped, this is indicated by the LED flashing

Benefits

- The devices with pole number 1P+N are available in a single modular width. This reduces the footprint by 50 %.
- The sliding catch for type ranges 8 x 32 mm and 10 x 38 mm enables the removal of individual devices from the assembly
- Space for a spare fuse in the plug-in module enables the fast replacement of fuses. This saves time and money and increases plant availability.
- A flashing LED signals that a fuse link has been tripped. This enables fast detection during runtime.

More information

Installation

Fuse holders, sizes 8 x 32 mm and 10 x 38 mm, have a sliding catch that enables the removal of individual devices from the assembly.

The infeed can be from the top or the bottom. Because the cylindrical fuse holders are fitted with the same anti-slip terminals at the top and the bottom, the devices can also be bus-mounted at the top or bottom.

Auxiliary switches

Auxiliary switches are available for cylindrical fuse holders, sizes 14 x 51 mm and 22 x 58 mm. These are simply clipped onto the base using the factory-fitted brackets. The auxiliary switches support the remote display of fuse failure. However, this is only the case if fuse links with strikers are used. When the fuse is tripped, a small striking pin - the striker - shoots out of the front of the fuse. Over an armature link in the auxiliary switch, the kinetic energy of this striker is used to switch a mini switch, which then initializes this signal over a floating contact.

BETA Protecting Low-Voltage Fuse Systems

Class CC fuse systems

勝特力材料 886-3-5753170
 勝特力电子(上海) 86-21-54151736
 勝特力电子(深圳) 86-755-83298787
[Http://www.100y.com.tw](http://www.100y.com.tw)

Overview

Class CC Fuses are used for "branch circuit protection".

The enclosed fuse holders are designed and tested to comply with the US National Electrical Code NEC 210.20(A). This means that when subject to continuous duty, only 80 % of the rated current is permissible as operational current.

An operational current of 100 % of the rated current (30 A) is only permissible short-time.

The devices are designed for the inscription labels of the ALPHA FIX 8WH8 120-7AA15 and 8WH8 120-7XA05 terminal blocks.

There are three different series:

- Characteristic: slow
For the protection of control transformers, reactors, inductances. Significantly slower than the minimum requirements of 12 s at $2 \times I_n$, as specified by UL for Class CC fuses.
- Characteristic: quick
For a wide range of applications, for the protection of lighting installations, heating, control systems.
- Characteristic: slow, current-limiting
Slow for overloads and quick for short-circuits. High current limiting for the protection of motor circuits.

Benefits

- For switchgear assemblies and mechanical engineers who export their plants. Compliance with the American standard is as follows:
- Approved according to UL and CSA for typical "Branch Circuit Protection" applications. This facilitates export.
- Modern design with touch protection to BGV A3 ensures safe installation.

Overview

Busbars with pin-type connections can be used for NEOZED safety switching devices and fuse bases. Busbars are available in 10 mm² and 16 mm².

Busbars with fork plugs are used for the most frequently used NEOZED fuse bases made of ceramic.

Benefits

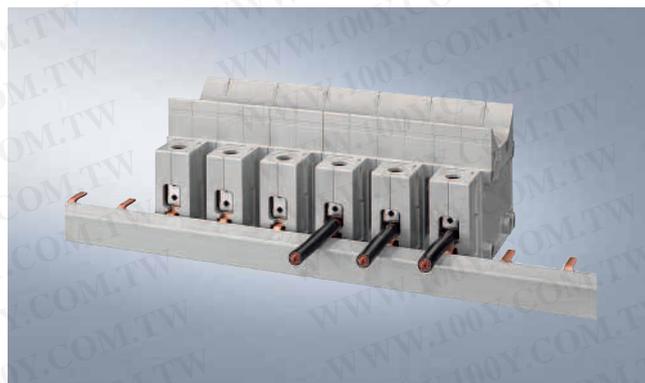

- Clear and visible conductor connection that can be easily checked when using MINIZED switch disconnectors D02. This facilitates cable entry and saves time.

- Bus-mounting of MINIZED switch disconnectors D01 with 3-phase pin busbar, which can be cut to length. A proven and frequently used application

- Bus-mounting of NEOZED disconnectors D01 with 3-phase pin busbar, which can be cut to length. Tried and tested.

- Clear and visible conductor connection that can be easily checked when using NEOZED comfort base D02. This facilitates cable entry and saves time.

- Bus-mounting of NEOZED fuse bases made of molded plastic on 3-phase busbar with fork plug, which can be cut to length. Frequently used.

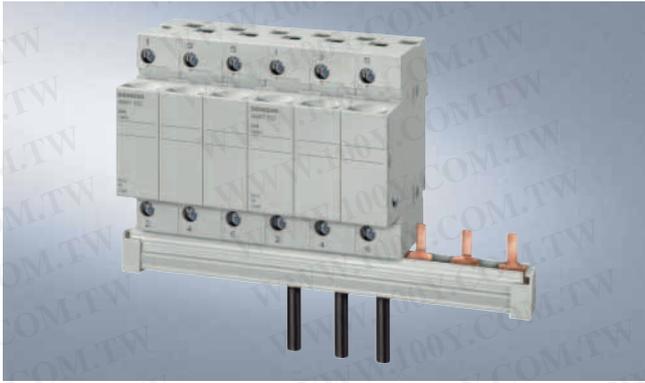

- Bus-mounting of NEOZED fuse bases made of ceramic on 3-phase busbar with fork plug, which can be cut to length. Most common application.

LV HRC fuse links

勝特力材料 886-3-5753170
 勝特力电子(上海) 86-21-54151736
 勝特力电子(深圳) 86-755-83298787
[Http://www.100y.com.tw](http://www.100y.com.tw)

Overview

LV HRC fuses are used for installation systems in non-residential, commercial and industrial buildings as well as in switchboards of power supply companies. They therefore protect essential building parts and installations.

LV HRC fuses are fuse systems designed for operation by skilled personnel. There are no constructional requirements for non-interchangeability of rated current and touch protection.

The components and auxiliary equipment are designed in such a way as to ensure the safe replacement of LV HRC fuses or isolation of systems.

LV HRC fuse links are available in the sizes 000, 00, 0, 1, 2, 3, 4 and 4a.

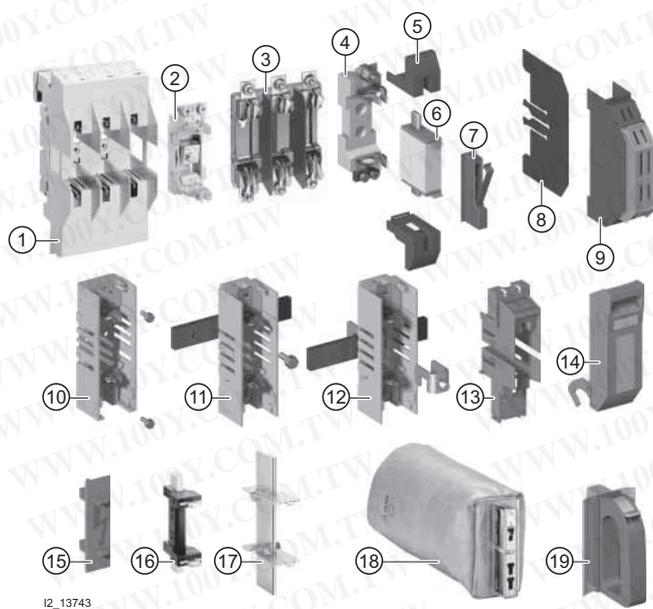

LV HRC fuse links are available in the following operational classes:

- gG for cable and line protection
- aM for the short-circuit protection of switching devices in motor circuits
- gR or aR for the protection of power semiconductors
- gS: The new gS operational class combines cable and line protection with semiconductor protection.

LV HRC fuse links of size 000 can also be used in LV HRC fuse bases, LV HRC fuse switch disconnectors, LV HRC fuse strips as well as in LV HRC in-line fuse switch disconnectors of size 00.

The fuse links 300 A, 355 A and 425 A comply with the standard but do not have the VDE mark.

LV HRC components

- ① LV HRC fuse base from the SR60 busbar system
- ② LV HRC fuse base for busbar mounting
- ③ LV HRC fuse base, 3P
- ④ LV HRC fuse base, 1P
- ⑤ LV HRC contact covers
- ⑥ LV HRC fuse link
- ⑦ LV HRC signal detectors
- ⑧ LV HRC partition
- ⑨ LV HRC protective cover
- ⑩ LV HRC fuse bases with slewing equipment,
- ⑪ - for screw connection on mounting plate
- ⑫ - for screw connection on busbar system
- ⑬ - for claw fixing on busbar
- ⑭ LV HRC protective cover for LV HRC fuse bases with slewing equipment
- ⑮ LV HRC slewing equipment
- ⑯ LV HRC fuse base cover
- ⑰ LV HRC isolating link with insulated grip lugs
- ⑱ LV HRC isolating link with non-insulated grip lugs
- ⑲ LV HRC fuse puller with sleeve
- ⑳ LV HRC fuse puller

Benefits

- LV HRC fuse links with combination alarm signal the tripping of a fuse by a clear color change from red to white. This enables fast identification and replacement of the tripped fuse links. This increases plant availability.
- The insulated grip lugs made of metal are integrated in the top and bottom covers of the fuse link in molded plastic and provide greater safety during replacement. The mark shown below indicates that the grip lugs are insulated 
- In the standard series with front indicator, the front-mounted red indicator signals the tripping of a fuse.
- LV HRC fuse links are always equipped with silver-plated contact pins. This means that they are non-corroding and have less contact resistance. This ensures the long-term operational safety of the plant.

BETA Protecting Low-Voltage Fuse Systems

LV HRC signal detectors

Overview

LV HRC signal detectors are used for remotely indicating that the LV HRC fuse links have been tripped. 3 different solutions are available:

- 3NX1 021 signal detectors with signal detector link 3
- 3NX1 024 signal detector top
- 5TT3 170 fuse monitors.

The LV HRC signal detectors with signal detector link support monitoring of LV HRC fuse links with non-insulated grip lugs of sizes 000 to 4 at 10 A or more.

The signal detector link is connected in parallel to the LV HRC fuse link. In the event of a fault, the LV HRC fuse links are released

simultaneously with the LV HRC fuse signaling link. A trip pin switches a floating microswitch.

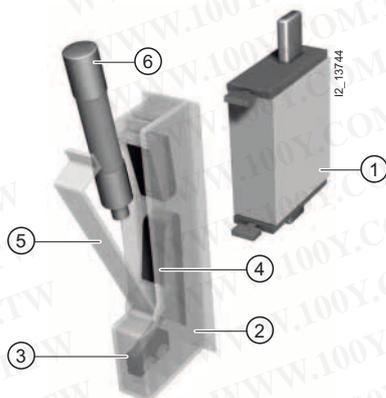

The signal detector top can be used with LV HRC fuse links, sizes 000, 00, 1 and 2, which are equipped with non-insulated grip lugs and have a front indicator or combination alarm. It is simply plugged into the grip lugs.

If a fuse is tripped, the front indicator springs open and switches a floating microswitch. This solution should not be used for safety-relevant plants. For this purpose, we recommend our electronic fuse monitors.

Benefits

LV HRC signal detectors reliably indicate when a fuse has tripped.

- ① LV HRC fuse link
- ② Signal detector
- ③ Microswitch
- ④ Spring contact
- ⑤ Hinged lid
- ⑥ Signal detector links

Tripped fuses are quickly located. This saves time and increases plant availability.

- ① LV HRC fuse link
- ② Front indicator
- ③ Signal detector tops
- ④ Rocker/lever arm

Fuse monitors
 For all low-voltage fuse systems.
 Can be used in asymmetric systems afflicted with harmonics and regenerative feedback motors. Alarm also for disconnected loads.

For further information, please refer to Catalog ET B1, chapter "Monitoring of Electrical Values".

Overview

Terminals for all applications

Terminals are as different as the requirements of individual systems.

Flat terminals with screws are suitable for connecting busbars or cable lugs. They have a torsion-proof screw connection with shim, spring washer and nut. When tightening the nut, always ensure compliance with the specified torque due to the considerable leverage effect.

The double busbar terminal differs from the flat connection in that it supports connection of two busbars, one on the top and one at the bottom of the flat connection.

The modern box terminal ensures efficient and reliable connection to the conductors. They support connection of conductors with or without end sleeves.

In the case of the flat terminal with nut, connection of the nut is torsion-proof. When tightening the nut, the torque must be observed because of the considerable leverage effect.

Up to three conductors can be clamped to the terminal strip.

The plug-in terminal is equipped for connecting two conductors.

One conductor can be clamped to the saddle-type terminal.

Benefits

- The silver-plated Lyra contact provides a large contact area for the contact pin of the LV HRC fuse link. This improves heat transmission and lowers the temperature. It also minimizes ageing of the fuse link in the maximum load range, in particular when using SITOR fuses
- The large contact area also facilitates replacement of LV HRC fuse links
- The spring washer tensioning the contact is mechanically galvanized. This will prevent hydrogen embrittlement. The contact is resistant to aging and there will be no dreaded annealing of contacts, which considerably improves operating safety.

BETA Protecting Low-Voltage Fuse Systems

LV HRC fuse switch disconnectors

Overview

SENTRON 3NP4 and 3NP5 fuse switch disconnectors are switching devices for the occasional manual switching/isolating of loads and distribution boards. They are able to switch on, lead and switch off the specified rated current (including a specific overload).

With the SENTRON 3NP4 and 3NP5 fuse switch disconnectors, all poles of downstream electric loads can be safely disconnected from the system under load.

The SENTRON 3NP4 and 3NP5 fuse switch disconnectors are ideal for surface mounting and installation on and in distribution boards (e.g. ALPHA, SIKUS), meter cabinets (e.g. ALPHA 400-ZS) and molded-plastic distribution systems, such as 8HP.

The ability to mount them on a range of different busbar systems allows their very diverse implementation in control cabinet and control engineering.

The sizes SENTRON 3NP4 LV HRC 0001 and LV HRC 00 can be snapped onto 35 mm standard mounting rails and are ideal for combining with other switching devices e.g. in capacitor modules for p.f. compensation.

The SENTRON fuse switch disconnectors 3NP4 and 3NP5 are used in conjunction with SITOR semiconductor fuses for the effective protection of frequency converters and soft starters (see section "SITOR semiconductor fuses").

Benefits

- The SENTRON 3NP4 and 3NP5 fuse switch disconnectors comprise a base and a fuse carrier with view and measuring window, which can be removed without tools. The removal and replacement of fuse links can also be carried out without tools. This considerably facilitates installation
- The three conducting paths in the base and the fuse links in the fuse carrier are separated by partitions that overlap when opening and closing the device. This type of intrinsic protection is called "complete compartmentalization" and effectively prevents phase arcing.
- SENTRON 3NP5 fuse switch disconnectors are also equipped with locating springs, which are fitted to the side of the base. These enable the "high speed closing" of devices, regardless of the actuation speed of the operator.
- The SENTRON 3NP4 and 3NP5 fuse switch disconnectors are used with LV HRC fuses of sizes LV HRC 000 to LV HRC 3 according to IEC 60269-2-1 and DIN VDE 43620. This supports additional applications.

¹⁾ See LV HRC Fuse Links.

²⁾ SIRIUS motor starter protectors/circuit breakers: auxiliary switches, 2 NC also available on request.

³⁾ For 3NP50 60 with flat connectors, the relevant 3NY1 106 cable lug covers must be used for the purpose of protection against accidental contact according to DIN VDE 0106-100 (see page 19/110).

⁴⁾ According to DIN 46234 or 16 mm² ... 95 mm² acc. to DIN 46235 (use M10 cable lugs if required).

⁵⁾ According to DIN 46234 or DIN 46235, with cable lug according to DIN 46235: min. conductor cross-section 16 mm² (use M12 cable lugs if required).

⁶⁾ For accessories and further devices on busbar systems, see accessories and switchgear, SIVACON distribution boards and cubicle systems, -> components for 8US, 8UC, 4NC distribution systems -> 8US busbar systems.

More information

SENTRON 3NP fuse switch disconnectors

3NP40 10 3NP40 70 3NP52 with opened fuse carrier

The SENTRON 3NP4 and 3NP5 fuse switch disconnectors are climate-proof and meet the requirements of IEC 60947-1, IEC 60947-3 and DIN VDE 0660-107.

For operation in heavily sulfurous atmospheres, the SENTRON 3NP5 series, and the 3NP40 1 and 3NP40 7 versions are available as tinned versions (delivery on request).

The SENTRON 3NP5 fuse switch disconnector series also complies with the standard BS 5419 and is approved for operation in shipboard systems (use approved fuse links).

All SENTRON 3NP4 and 3NP5 fuse switch disconnectors can be sealed as standard (or can be sealed through accessories).

Fuse monitoring by SIRIUS motor starter protectors/circuit breakers

For fuse monitoring, a SIRIUS motor starter protector/circuit breaker is factory-fitted and hard-wired to the fuse carrier of the SENTRON 3NP4 and 3NP5 fuse switch disconnectors. If the fuse carrier is closed, the three conducting paths of the SIRIUS motor starter protector/circuit breaker are switched in parallel to the fuse links to be monitored. If the fuse carrier is open, all main current paths of the motor starter protector/circuit breaker are off circuit. The internal resistance of the motor starter protector/circuit breaker is great enough not to impair the protective function of the monitored fuse links. Failure of a fuse will trip the motor starter protector/circuit breaker.

Electronic fuse monitoring EF

For electronic fuse monitoring, the EF monitor is factory-fitted and hard-wired to the fuse carrier of SENTRON 3NP5 fuse switch disconnectors.

The EF monitor works independently of any loads. Failure of a fuse can be relayed to a control room through integrated auxiliary switches (2 NO + 1 NC) by means of a centralized fault indication or used to isolate the load through e.g. a contactor. Actuation of the auxiliary switch will depend on the EF version. Version "A" stands for "open-circuit principle", version "R" for closed-circuit principle" (see schematic circuit diagram).

If a fuse is tripped, a green LED signal flashes (general fault) and the location of the failed fuse is indicated by a red LED. Using more than one device facilitates identification of the affected branch circuit. The EF monitor is automatically reset to the standby position once the faulty fuses are replaced. This state is indicated visually by the status display (green LED). The EF monitor is also suitable for operation in industrial networks badly afflicted by harmonics.

Auxiliary switches

The SENTRON 3NP4 and 3NP5 fuse switch disconnectors can also be retrofitted with auxiliary switches for indicating the switch position of the fuse carrier. One switching block (1 CO) can be mounted on SENTRON 3NP4 fuse switch disconnectors size LV HRC 000 and two switching blocks (1 CO) on sizes LV HRC 00 to LV HRC 3 respectively. SENTRON 3NP5 fuse switch disconnectors can also be delivered with a 2-pole auxiliary switch (1 NO + 1 NC) if required. The version with fuse monitoring is fitted with this auxiliary switch as standard.

The auxiliary switch of the motor starter protector/circuit breaker can be used for indication purposes or to disconnect the main circuit, e.g. through a contactor. The signal cable for the SENTRON 3NP4 fuse switch disconnector, size LV HRC 00, must be ordered separately. Sizes LV HRC 1 to LV HRC 3 are connected using flat terminations. Delivery of the SENTRON 3NP5 fuse switch disconnectors includes the signal cable, complete with connector. SIRIUS motor starter protectors/circuit breakers cannot be used for fuse monitoring in branch circuits by motor starter protectors/circuit breakers where a fault may result in > 220 V DC feedback. In the case of parallel cables and meshed systems, only a voltage difference of > 24 V at the switch will trip the motor starter protector/circuit breaker.

BETA Protecting SITOR Semiconductor Fuses

SITOR, LV HRC design

Overview

SITOR fuses protect power semiconductors from the effects of short-circuits because the super quick disconnect characteristic is far quicker than with conventional LV HRC fuses. They protect expensive devices and system components such as converters with fuses in the input and in the DC link, UPS systems and soft starters for motors.

Panel mounting requirements have given rise to various connection versions.

The fuses with blade contacts comply with IEC 60269-2 and are suitable for installation in LV HRC fuse bases, in LV HRC fuse switch disconnectors and in switch disconnectors with fuses. They also include fuses with slotted blade contacts for screw mounting with 110 mm mounting dimension, whose sizes comply with IEC 60269-4.

Fuses with slotted blade contacts for screw mounting with 80 mm or 110 mm mounting dimension are often screwed directly onto busbars for optimum heat dissipation. Even better heat transmission is provided by the compact fuses with M10 or M12 female thread, which are also mounted directly onto busbars.

Bolt-on links with 80 mm mounting dimension are another panel-mounting version for direct busbar mounting.

The fuses for SITOR thyristor sets, railway rectifiers or electrolysis systems were developed specially for these applications.

For LV HRC fuse bases and LV HRC fuse switch disconnectors, see the catalog section "Low-voltage fuse systems".

For more information and characteristic curves for the configuration and assignment of SITOR fuses to the 3NP and 3KL fuse bases and safety switching devices, see the catalog ET B1 "Add-On Characteristics Curves • 2008".

Benefits

- SITOR fuses have a high varying load factor, which ensures a high level of operating safety and plant availability - even when subject to constant load change.
- The use of SITOR fuses in our bases or switch disconnectors has been tested with regard to heat dissipation and maximum current loading. This makes planning and dimensioning easier and prevents consequential damage.
- Our high standard of quality ensures good compliance with the characteristic curve and accuracy. This ensures long-term protection of devices.

SITOR, cylindrical fuse design

Overview

SITOR cylindrical fuses protect power semiconductors from the effects of short-circuits because the super quick disconnect characteristic is far quicker than that of conventional fuses. They protect expensive devices and system components such as solid-state contactors, electronic relays (solid state), converters with fuses in the input and in the DC link, UPS systems and soft starters for motors up to 100 A.

The cylindrical design is approved for industrial applications. The cylindrical fuse links comply with IEC 60269.

Cylindrical fuse holders also comply with IEC 60269 and UL 512. The cylindrical fuse holders for 10 x 38 mm and 14 x 51 mm have been tested and approved as fuse switch disconnectors and the cylindrical fuse holders for 22 x 58 mm as fuse disconnectors according to the switching device standard IEC 60947-3. The utilization category and the tested current and voltage values are specified in the Table "Technical Specifications" (Catalog ET B1, edition 2008).

The cylindrical fuse holders have been specially developed for the application of SITOR fuse links with regard to heat tolerance and heat dissipation and are therefore not recommended for standard applications.

Cylindrical fuse bases do not offer the same comprehensive touch protection as the fuse holders, but have better heat dissipation. The single-pole cylindrical fuse bases for 14 x 51 mm and 22 x 58 mm allow modular expansion to multipole bases.

Benefits

- Cylindrical fuses have an extremely compact design and a correspondingly small footprint
- The cylindrical fuses have IEC and UL approval and are suitable for universal use worldwide.
- The use of SITOR cylindrical fuses in the cylindrical fuse holders and bases has been tested with regard to heat dissipation and maximum current loading. This makes planning and dimensioning easier and prevents consequential damage.
- The use of fuse holders as switch disconnectors expands the area of application of these devices and increases operating safety.

BETA Protecting SITOR Semiconductor Fuses

SILIZED, NEOZED and DIAZED design

Overview

SILIZED fuses protect power semiconductors from the effects of short-circuits because the super quick disconnect characteristic is far quicker than that of conventional fuses.

They protect expensive devices and system components such as solid-state contactors, static relays, converters with fuses in the input and in the DC link, UPS systems and soft starters for motors up to 100 A.

The SILIZED fuse links have a higher power loss than standard fuse links. It is therefore important to take into account the maximum permissible power dissipation of the fuse base.

The DIAZED screw adapter DII for 25 A is used for the 30 A fuse link.

Benefits

- SILIZED fuses have an extremely compact design. This means they have a very small footprint - particularly the NEOZED version.
- The rugged and well-known DIAZED design complies with IEC 60269-3. It is globally renowned and can be used in many countries.
- A huge range of fuse bases and accessories are available for the NEOZED and DIAZED versions of the SILIZED fuses. This increases the application options in many devices.

Overview

The use of busbar systems with their versatile rail-adaptable connection, switching and installation devices is an ideal and cost-effective electrotechnical enhancement of modern distribution

boards due to their small footprint, compact design and quick assembly contacts. Mounting is implemented on longitudinal stays. The busbar spacing is 60 mm.

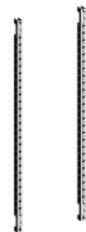

- ① Longitudinal stays
- ② Busbar supports, 3-phase
- ③ Cu busbars
- ④ Terminals
- ⑤ Supports for blanking covers
- ⑥ Blanking covers
- ⑦ Supports
- ⑧ Touch protection covers
- ⑨ Busbar supports, 1-phase

Benefits

- Only a few distribution board components are required to ensure the integration of busbars in the distribution board. This saves time and space.
- The touch protection cover is sealable as standard and is quick and easy to attach to the supports thanks to the use of quick-release locking technology.

More information

Material properties

Busbar supports and bus-mounting fuse bases (see the chapter section "Built-in components") are manufactured from glass-fiber reinforced, thermoplastic polyester (color RAL 7035, light gray). The material ensures excellent mechanical, chemical and electrical properties. Furthermore, the material has an extremely low flammability and meets the requirements of UL 94 V0. This satisfies the load requirements of the busbar supports at rated operational voltage 500 V and rated currents at 200 A to 630 A, as well as the rated short-circuit strength 50 kA.

Ambient temperatures

When dimensioning the busbars based on rated currents, the ambient temperature and the Cu busbar temperature must also be taken into account.

The location of the busbar system and its ability to dissipate heat through convection also play a key role in this calculation. Because conditions can vary for each distribution board, the values in the following table serve as a guideline only. However, they must be applied to the entire busbar length.

Continuous currents depending on the Cu power rail dimensions and Cu busbar temperatures at 35 °C ambient temperature

Cu busbar dimensions H x D mm x mm	Uninterrupted current for open busbar run ambient temperature 35 °C	Uninterrupted current of fuse link g/L/g operational class
	A	A
12 x 5	200	200
12 x 10	360	315
15 x 5	250	250
15 x 10	447	400
20 x 5	320	315
20 x 10	520	500
25 x 5	400	400
25 x 10	580	500
30 x 5	447	400
30 x 10	630	630

As far as other types of upstream protective devices are concerned, please observe the permissible uninterrupted current of the busbar.

Distribution board components

Dynamic rated short-circuit strength

The electrodynamic load of the busbars depends on the level of short-circuit current, the length of the busbar section through which the current flows, the support spacing of the busbar supports and, of course, on the distance between the busbars themselves. Because, for example, an LV HRC fuse is connected upstream to the busbars in the protective device, the let-through current i_D is the maximum current to flow through this protective device. The value i_D depends on the maximum system short-circuit current and the current-limiting action of the protective device used. The permissible let-through values of the protective equipment are specified by the manufacturers in the form of a current limitation diagram as a function of the so-called prospective short-circuit current (r.m.s. value of the possible rated short-circuit current for the system).

You will find the current limiting characteristics of the fuse links in the catalog ET B1 Add-On • 2008, Characteristic curves.

Diagram of the dynamic short-circuit strength of the busbars

i_D : Let-through values (kA) of the LV HRC fuse links, gL/gG operational class with rated current 200 A to 630 A for a prospective short-circuit current $I_D = 120$ kA.

For busbar supports with busbars of 12 x 5 mm to 20 x 5 mm, the distance between the holders of the support spacing should be adapted to suit the bars in the distribution board and, if possible, should not exceed 250 mm. When using busbars of 25 x 5 mm, 30 x 5 mm, 12 x 10 mm to 30 x 10 mm, this distance can be increased up to 500 mm. In the case of larger distances, subcarriers must be fitted as increased support spacing reduces the dynamic stability.

It is essential to ensure that the permissible current carrying capacity of the individual busbars is not exceeded. A center infeed is required in the limit range. However, the infeed can also be carried out from both sides of the busbar ends.

BETA Protecting SR60 Busbar Systems

Built-in components

Overview

Rail-adaptable built-in components, such as NEOZED and DIAZED bus-mounting bases, adapters for modular installation devices, LV HRC fuse switch disconnectors and NEOZED bus-mounting

fuse switch disconnectors are made of glass-fiber reinforced, thermoplastic polyester. The material ensures required mechanical, chemical and electrical properties.

- ① 3-pole NEOZED bus-mounting base
- ② 3-pole DIAZED bus-mounting base
- ③ NEOZED bus-mounting switch disconnectors
- ④ Adapter for modular installation devices according to DIN 43880
- ⑤ LV HRC fuse switch disconnectors

Benefits

- The direct contact of the rail-adaptable switching and installation devices on the Cu busbars reduces distribution panels and assembly times.
- The transfer resistance of the connections are drastically reduced, when compared to conventional installation. This prevents unnecessary waste heat.

Overview

The mounting components enable an enclosed design on a mounting plate.

The base, the holders for the edges, the edges, the supports for blanking covers with blanking cover and the end covers form a complete enclosure with degree of protection IP20.

- ① End covers
- ② Bases
- ③ Edges
- ④ Blanking covers
- ⑤ Holders

Benefits

- The mounting components enable a closed design for the SR 60 busbar system in any switchgear assembly.
- The touch protection rating to IP20 means that operation is safe, even for non-specialists.

BETA Protecting Overvoltage Protection Devices

Lightning arresters, type 1

Overview

Lightning arresters, type 1 include the power lines in the lightning protection equipotential bonding, thus protecting low-voltage load systems against overvoltages and high surge currents caused by direct or indirect lightning strikes.

The protection level is lowered to 1.5 kV by the lightning arrester, which reduces the load on the plant if a lightning strike is discharged.

The lightning arresters are enclosed and suitable for mounting in the precounter sector.

The lightning arresters are tested using wave-shaped lightning impulses, 25/100 kA with waveform 10/350 μ s.

Benefits

- Lightning arresters, type 1 require no decoupling reactors in the system. As the result, system design is simplified and less space needed. No time is wasted on planning the installation of decoupling reactors. This considerably cuts costs.
- The rated arrester voltage is a uniform 350 V AC. This increases safety in systems with extended voltage overshoots.
- All the lightning arresters have a mechanical fault indication that needs no additional energy. This means they can be installed in the precounter area, where electrical plants can be protected particularly effectively.
- The protective blocks are plug-in versions. Replacing the protective blocks involves no installation work. When taking insulation measurements, the protective modules are simply removed, no need to disconnect the power supply.
- All lightning arresters, type 1 have a remote signaling contact that is inserted into the device and takes up no space. Remote signaling in case of failure is always possible.

Combination surge arresters, type 1 and type 2

Overview

Type 1 and 2 combination surge arresters include the system cables in the equipotential bonding, which protects the low-voltage systems against the overvoltages and high currents that can be triggered by direct lightning strikes. They are tested by wave-shaped lightning impulse currents 25 ... 100 kA with waveform 10/350 s.

The protection level is lowered to 1.5 kV by the combination surge arrester, which reduces the load on the plant if a lightning strike is discharged.

A thermal isolating arrester disconnecter offers a high degree of protection against overload during runtime.

Benefits

- Combination surge arresters, type 1 and 2 require no decoupling reactors in the system. As the result, system design is simplified and less space needed. No time is wasted on planning the installation of decoupling reactors. This considerably cuts costs.
- The rated arrester voltage is a uniform 350 V AC. This increases safety in systems with extended voltage overshoots.
- All combination surge arresters are fitted with a mechanical fault indication, which does not require an extra power supply.
- The protective modules are plug-in versions. Replacing the protective blocks involves no installation work. When taking insulation measurements, the protective modules are simply removed, no need to disconnect the combination surge arresters from the power supply.
- The same type 2, class II overvoltage protective modules are used as for the slim version of the surge arresters (5SD7 42.). This simplifies stock keeping
- All combination surge arresters have a remote signaling contact that is inserted into the device and takes up no space. Remote signaling in case of failure is always possible.

BETA Protecting Overvoltage Protection Devices

Surge arresters, type 2

Overview

Surge arresters, type 2 are used after lightning arresters, type 1 in main distribution boards or sub-distribution boards. They protect low-voltage systems against transient overvoltages.

The surge arrester, type 2 lowers the protection level from 1.4 to 1.5 kV. A remote signaling contact shows whether a protective module has been disconnected from the network by the thermal arrester disconnecter or whether it is just not plugged in.

Benefits

- Surge arresters, type 2 require no decoupling reactors in the system. As the result, system design is simplified and less space needed. No time is wasted on planning the installation of decoupling reactors. This considerably cuts costs.
- The rated arrester voltage is a uniform 350 V AC. This increases safety in systems with extended voltage overshoots.
- All surge arresters, type 2 are fitted with a mechanical fault indication, which does not require an extra power supply
- A thermal isolating arrester installed in each device offers a high degree of protection during runtime. In the event of overload, the surge arrester is disconnected from the mains - the plant continues running.
- The protective modules are plug-in versions. Replacing the protective blocks involves no installation work. When taking insulation measurements, the protective modules are simply removed, no need to disconnect the surge arrester from the power supply.
- Surge arresters, type 2 are available with a remote signaling contact, which is integrated in the device and does not require any further space in the distribution board.

BETA Protecting Overvoltage Protection Devices

Surge arresters, type 3

Overview

Surge arresters, type 3 are installed after the surge arresters, type 2 in sub-distribution boards close to the loads in single or multiphase systems and further limit the overvoltage in order to protect the connected loads.

Surge arresters, type 3 in voltage versions 24, 60, 120 and 240 V can be used in both AC and DC systems.

Benefits

- The protective modules are plug-in versions. No mounting work required when replacing the protective modules
- All surge arresters, type 3 are fitted with a mechanical fault indication, which does not require an extra power supply
- Remote signaling is performed by an optocoupler with an open collector output in case of failure. This enables fast detection of faults.

BETA Protecting Overvoltage Protection Devices

Overvoltage protection adapters

Overview

Overvoltage protection adapters, type 3 for insertion in a (SCHUKO) socket outlet protect electronic loads against overvoltages from main power supplies.

Such devices are exposed to overvoltages not only from the power line. Telecommunication devices for TAE, ISDN/RDS and RJ12 connection, televisions or radios with aerial connection or satellite radio connection are all connected to a further power supply system which can also pass overvoltages on to devices.

Benefits

- All overvoltage protection adapters, type 3 are fitted with an LED as a visual status and fault indication
- There is permanent thermal monitoring of the protection circuit. Hence the user is always assured of safe operation.

Socket outlets

Overview

The socket outlets for mounting in distribution boards to DIN 43880 and on standard mounting rails to DIN 60715 have since become standard in modern switchgear assemblies/distribution boards. They are used for tasks such as the connection of plug-in communication devices in communication distribution boards, in switchgear assemblies for maintenance purposes or in private plants for the occasional use of devices with heavy starting and separate fusing. The socket outlet range complies with a number of different standards and is available according to the standards of the following countries: VDE for Germany, CEE7 for Belgium/France, CEI for Italy and UL for USA.

In distribution boards with 55 mm mounting depth the socket outlet can only be used without the hinged lid. The lids can be retrofitted on all devices.

To make installation easier, the terminals L, N and PE with touch protection are located on the side of the socket outlet.

In plant sections where equipment is still live, even after the main control switch has been disconnected, this must be indicated according to DIN VDE 0105-1 and IEC/EN 60204-1/ DIN VDE 0113-1. Yellow socket outlets are used for these applications.

Benefits

- Complete program according to VDE, UL, CEI and CEE for worldwide application.
- By pulling on the hinges, the hinged lid stays open at more than 180°. This facilitates manual insertion of plugs.

BETA Switching Socket Outlets

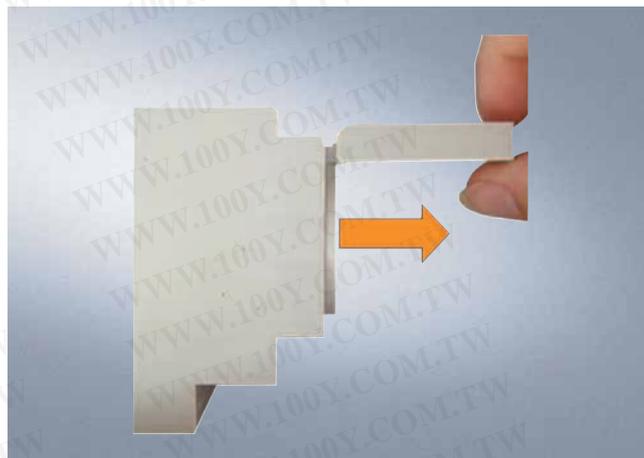

Socket outlets

More information

Hinged lid for simple application

The hinged lid can be opened at an angle greater than 180°.

By pulling on the hinges, the covers stay open, which facilitates plugging in. The hinged lids can be retrofitted on all versions.

In order to make sure that it is possible to work on the distribution board in the event of a voltage failure, we recommend that the infeed socket outlet is fed using a short-circuit current proof cable installation and a separate fuse. The yellow socket outlet must be used for this purpose.

Overview

Multimeters are mainly used by switchgear engineers in power distribution boards for infeeds into buildings and plants. They replace the more common analog voltmeters and ammeters with measuring point changeover, as well as measuring devices for power outputs and power factor p.f.

The standard measured quantity to be indicated in the 5 display fields of the multimeter can be tailored to customer requirements. Versions for direct connection (63 A) or for transformers (5 A) with adjustable transformer primary current from 5 to 5000 A, enable a wide range of application.

The green 7-segment displays for the measured values and the orange indicators of the units of measurement directly alongside the measured values make for easy reading.

Benefits

- Clear display of all necessary measured values
- All measured values can be read from a distance
- Customized setting of the measured quantities for the standard display
- Wide range of application thanks to flexible adaptation to measuring current transformers
- Detection of connection errors during start-up saves considerable time when trying to locate faults.
- Large, 11 mm high, green 7-segment displays for measured values makes for easy reading
- Indication of units of measurement directly alongside the related measured values provide a clear overview.

More information

Voltage measurement

The multimeter measures the delta voltages L1 against L2; L2 against L3 and L3 against L1 or the star voltages L1, L2, L3 against N.

ΣL symbol for the 3-phase system

This indicates that all physical units shown under this symbol are always 3 phase.

Readout data

You can continuously display 5 measured quantities from the following 23 options.

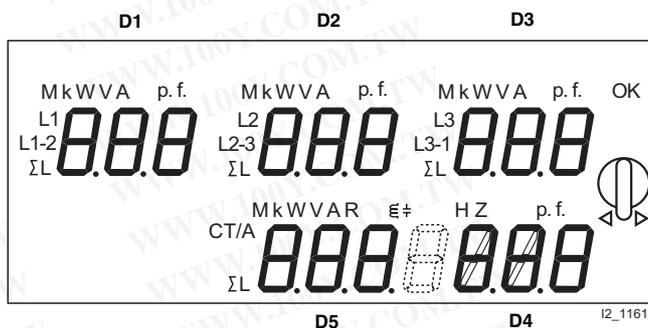

No.	Measured value	Display	Unit	Assignment
1	Active power	D1	W	L1
2	Voltage	D1	V	L1
3	Current	D1	A	L1
4	Apparent power	D1	VA	L1
5	p.f.	D1	p.f.	L1
6	Voltage	D1	V	L1 – L2
7	Active power	D2	W	L2
8	Voltage	D2	V	L2
9	Current	D2	A	L2
10	Apparent power	D2	VA	L2
11	p.f.	D2	p.f.	L2
12	Voltage	D2	V	L2 – L3
13	Active power	D3	W	L3
14	Voltage	D3	V	L3
15	Current	D3	A	L3
16	Apparent power	D3	VA	L3
17	p.f.	D3	p.f.	L3
18	Voltage	D3	V	L3 – L1
19	Active power	D1, D2, D3, D5	W	ΣL
20	Apparent power	D1, D2, D3, D5	VA	ΣL
21	Reactive power	D5	var	ΣL
22	Frequency	D4	Hz	ΣL
23	p.f.	D1, D2, D3, D4	p.f.	ΣL

2 set values are also indicated:

24	Transformer setting	D5	CT/A	/5
25	Transformer setting		CT/A	5 ... 5000

Display

The multimeters have a covered, brightly lit LED display. The measured values are indicated on an 11 mm high, green, 7-segment LED, the physical units are indicated by orange text abbreviations. Both colors are easier to recognize than the red LEDs used for conventional displays. Capacitive loads are automatically indicated by a capacitor symbol, inductive loads by a coil symbol – also in orange.

Matrix selection

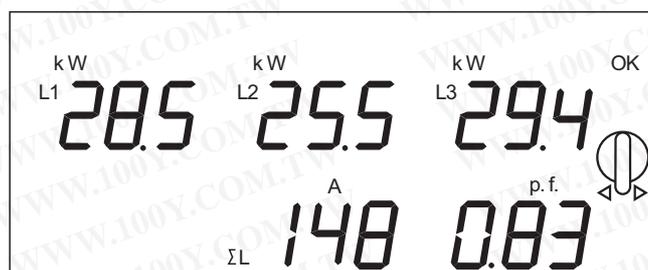

Conventional measuring instruments display voltages, currents, powers, etc. in a rigid sequence on several "screens". These multimeters allow users to define their own standard for measured quantities per display field, so that they can be implemented far more universally and flexibly.

A special feature is the analysis of the different loads on the phases. Phase displacement and unsymmetrical or unbalanced loads can cause partial overloads. These multimeters offer a range of different options for combining and assessing measured values.

The display fields are selected using rotary switches and the desired indications confirmed with OK. By making the horizontal selection e.g. W V A or p.f., and the vertical selection, e.g. L1, L1-L2 or ΣL , users can then define the desired measured quantities for this display field.

The vertical data on the display can be assigned to any measured value in the horizontal data. The letters M(ega) and k(ilo) are automatically assigned according to measuring range, i.e. measured value, e.g. kW or MW. Capacitive loads are automatically indicated by a capacitor, inductive loads by a coil.

The following diagram shows an example of what your matrix selection might look like.

勝特力材料 886-3-5753170

BETA Measuring Three-Phase Measuring Devices

Multicounters

Overview

Multicounters are mainly used by switchgear engineers in power distribution boards for infeeds into buildings and plants. They replace the more common analog voltmeters and ammeters with measuring point changeover, as well as measuring devices for power outputs and power factor p.f.

The standard measured quantity to be indicated in the 6 display fields of the multicounter can be tailored to customer requirements. The measured values of all measured quantities can also be displayed quickly and easily over the operator buttons. Versions for direct connection (63 A) or for transformers ($\sqrt{5}$ A) with adjustable transformer primary current from 5 to 5000 A, enable a wide range of application.

The green, eye-friendly 7-segment displays for the measured values and the orange indicators of the units of measurement directly alongside the measured values make for easy reading.

Benefits

- Clear display of all necessary measured values
- All measured values can be read from a distance
- Customized setting of the measured quantities for the standard display Fast display of all measured quantities over operator buttons
- Wide range of application thanks to flexible adaptation to measuring current transformers
- Detection of incorrect connections during installation
- Communication with LAN, Modbus or PROFIBUS DP enables integration in an energy management system
- Software package for data transmission over LAN and visualization of measurement data with Microsoft EXCEL enables implementation of customized solutions.

Multicounters

More information

Communication interfaces

Multicounters with PROFIBUS interface

Multicounters are also available with PROFIBUS interface. In a PROFIBUS network, the multicounters act as PROFIBUS DP slave according to the usual standard V0 (cyclic communication only).

In a PROFIBUS network, several PROFIBUS slaves are always assigned to a single master. A PC with a PROFIBUS communication module or PLC, such as the PLCs of the SIMATIC range from Siemens, can be used as the master. The master communicates with the connected slaves cyclically at extremely brief intervals. The master sends the slaves a request message to which the slave replies with a response message. The communication frame of the message (e.g. number of send and receive bytes) is slave-specific and is defined in a standardized text file; the device data base file (DDBF). This DDBF file is read in by the software configuring tools of the various PROFIBUS masters, whereby the master knows which communication frame the respective slave requires.

In normal cyclic mode, the multicounter sends a response message in the specified communication frame in reply to the request message from the master. This communication frame contains all 35 measured quantities in encoded form as user data. The master receives the message, decodes it and then uses the measurement data for a range of tasks.

As well as the DDBF file, a detailed description of the communication and the configuration of the user data are also required for the configuration and implementation of a PROFIBUS network with multicounters. For more information please visit us on the Internet at: <http://www.siemens.com/beta>

Multicounters with Modbus interface

The Modbus RTU is a very common communications solution. It is a serial, asynchronous form of communication, which requires RS 485 networks as the hardware platform. RS 485 networks can be set up with 2-wire copper or optical fiber cables and, compared to the RS 232 serial interface, offer fast transmission rates.

In a Modbus network, each bus station has a bus address within the range from 1 to 255. All stations within a network must be set to the same transmission speed. We recommend transmission rates of 9600 or 19200 bit/s. The address and transmission rate can be set in the user menu of the multicounters.

In order to customize a Modbus installation, it is necessary to implement the appropriate software application for the master. This requires specific information about communication with multicounters. You will find further information on the Internet at <http://www.siemens.com/beta>

Multicounters with LAN coupler on LAN

The 7KT1 390 LAN couplers support connection of up to ten 7KT1 34 multicounters to a LAN network. The LAN couplers and multicounters are interlinked over an RS 485 network. Setting the bus address in the 7KT1 34 multicounters to "0" specifies that it is operating in "LAN" mode. It is not necessary to set the transmission speed, as a fixed transmission rate is always used in this mode. It is also not necessary to set the address of the bus stations, as the LAN coupler automatically detects and identifies the multicounter connected.

The server components run on the PC in the background and handle the data transmission and storage of the most recent measured values from all the multicounters connected over one or more LAN couplers.

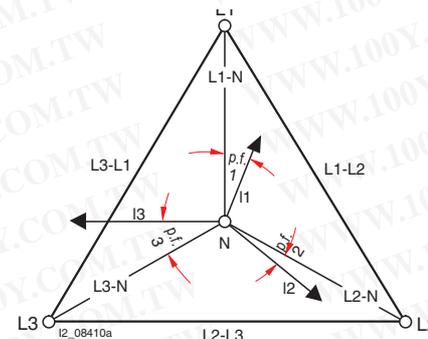

For more information on LAN operation and the MS Excel user interface, see 7KT1 390 LAN couplers on page 19/150 ff.

Voltage measurement

Depending on the selected connection type, the multicounter measures the delta voltages L1 against L2; L2 against L3 and L3 against L1 or the star voltages L1, L2, L3 against N.

3L symbol for the 3-phase system

This indicates that all physical units shown under this symbol are always 3 phase.

Temperature

The temperature information of the multicounter is not suitable for an exact measurement of the ambient temperature. The device does not have a temperature sensor. It is also not possible to connect an external temperature sensor.

The temperature information merely enables a rough estimate of the temperature conditions in the device interior and immediate vicinity.

LAN couplers

Overview

A LAN coupler supports the worldwide data recall of up to 10 multimeters and E-counters over a LAN link to the Internet.

The LAN coupler is used in conjunction with multimeters and E-counters. Up to 10 devices can be linked with a LAN coupler. In turn, the LAN coupler is connected to a LAN.

Data communication between the LAN coupler and the PC takes place using the TCP/IP protocol.

Using the software supplied with the LAN coupler, the measured data from several measuring devices can be called up over several LAN couplers for saving on a PC. The measured data are displayed by a macro based on MS Excel.

Benefits

- Integration of measuring devices in industrial or office communication
- Display of measured data using the standard software MS Excel
- Use of existing local networks (LAN) for transmitting the measured data
- TCP/IP data protocol enables a wide range of applications
- Limit value signals with time information for all measured values increases your plant's safety
- Open software structure enables the implementation of customized solutions for measured data indication and analysis
- Worldwide communication of the measured values via LAN
- One LAN coupler for 10 devices

More information

Connection of the LAN coupler to a LAN

Each station in a LAN must be assigned its own IP address. On delivery, or after a reset, the LAN coupler has a standard IP address. The new IP address must be set in the LAN coupler during start-up. To do this, the LAN coupler must be directly connected to a PC using a so-called "cross-over" cable. This is a network cable in which the transmit and receive wires are cross-connected. This creates a small LAN with 2 stations, PC and LAN coupler can communicate with each other directly. The supplied LAN coupler configuration tool must be installed on the PC. This direct connection can then be used to set a new IP address in the LAN coupler, as well as other network parameters, such as subnet mask and default gateway. The LAN coupler must then be connected to the target network as communication is subsequently only possible with the new settings.

Connection of measuring devices to the LAN coupler

E-counters and multimeters are connected to the LAN couplers over their communication interface. The network is an RS 485 network in which devices are connected over a shielded 2-wire cable. When using Modbus, the device address and transmission rate must be set in the multimeters. This is not necessary if using the multimeters and E-counters over the LAN coupler, as the LAN coupler automatically detects and identifies any connected E-counters and multimeters. You can now use the LAN coupler configuration tool (over the LAN network) to tell the LAN coupler from which device you want to retrieve the measurement data.

The LAN coupler carries out a so-called "polling" during runtime. This cyclically retrieves the most recently gathered measurement data from the measuring devices and buffers them in the LAN coupler. This can then be called up at any time over the LAN.

Data transmission from LAN coupler to PC

This data transmission is PC-controlled. A software tool runs in the background on the PC and uses the network to cyclically retrieve any measurement data from all available LAN couplers and save it to the hard disk.

Software tool

The supplied software tool has the following functions:

- Background transmission of measurement data from multimeters and E-counters and a number of LAN couplers
- Full display of device measurement data through a macro based on MS Excel
- Adjustable limit value signals for measured quantities
- Limit violations are signaled with time stamp.

You will find further information on Modbus operation on the Internet at: <http://www.siemens.com/beta>

Display of measurement data on the PC

A Visual Basic macro for MS Excel is supplied with the LAN coupler for the display of measurement data on a PC. Among other things, this software tool lets you display all 35 measurement data of a 7KT1 34 multimeter on a single panel. You can then select the various measuring devices you want to display from a small list box. The software also lets you set alarm limits for up to 10 measured values of a multimeter.

If a measured value exceeds or falls below the specified limits, the relevant indication is output, complete with time stamp from the PC clock.

Measwert	Anzeige	Einheit	Zuordnung	Wert	kleiner	Alarngrenzen	Verzögerung	Datum	Alarm	Wert

Display of measurement data of a multimeter

Simultaneous display of measurement data on more than one PC

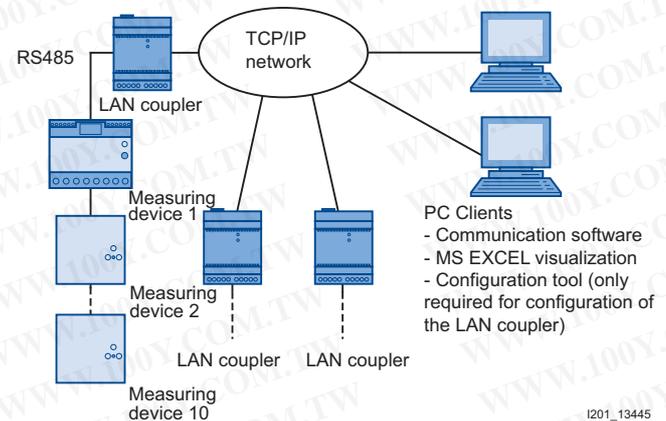

The software supplied with the LAN coupler supports display of measurement data on any number of PCs connected to the network over a client-server architecture.

A PC acts as the server, similar to an Intranet or Internet server. This PC runs the software components that retrieve the measurement data from the LAN coupler and save it to hard disk. The MS Excel macro can be used to visualize the measurement data on both the server PC and the clients.

Other client PCs can access the data pool of the server PC to visualize the measurement data.

Open software architecture

The architecture of the software tool is open and can be customized to suit user requirements. The MS Excel macros are freely accessible and can also be customized by the user.

E-counters

Overview

E-counters are used to measure the power consumption in 3-phase systems, e.g. in industrial plants, offices and apartments in apartment houses.

Cost pressures are growing, particularly in industry. Product operating times are reduced and manufacturing facilities must be retrofitted more frequently. The load levels of the distribution boards during operation are therefore constantly under observation in order to avoid peak loads in a timely manner or to perform retrofitting.

The versions with LAN interface are used for consumption analysis and minimization of operating costs in industrial plants and office buildings. This allows a readout to be performed easily using an existing LAN network.

The devices indicate 6 measured values on an LCD display: active energy rate 1 and rate 2, reactive energy rate 1 and rate 2, active power and reactive power. This means that the current load of a distribution board can be read out.

Benefits

- Easy read out and visualization of measured data using standard MS Excel software means solutions can be tailored to user requirements
- The devices indicate the instantaneous power in addition to the consumption, providing an overview of plant capacity utilization at all times and saving additional measuring devices into the bargain
- For practically unlimited use: E-counters for direct connection, 63 A for small plants and up to 5000 A with transformer for large plants.

Function

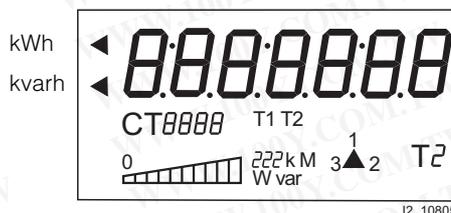

E-counters with LAN coupler on LAN

The 7KT1 390 LAN couplers support connection of up to ten 7KT1 52 E-counters to a LAN network.

For more information on LAN operation and the MS Excel user interface, see 7KT1 390 LAN couplers on page 19/150 ff.

Display

The display of the E-counters comprises a 7-digit 7-segment display for measured quantities and additional function indications:

		Unit	ID
Active energy	Rate 1	kWh	Arrow and T1
	Rate 2	kWh	Arrow and T2
Reactive energy	Rate 1	kvarh	Arrow and T1
	Rate 2	kvarh	Arrow and T2
Active power		kW	Utilization and instantaneous value
Reactive power		kvar	Utilization and instantaneous value
Phase-sequence indication	1-2-3		Flashing triangle next to left-hand phase sequence
Transformer primary current	5 ... 5000 A		CT (current transformer)

Overview

E-counters are used for the measurement of kWh in single- and three-phase systems, e.g. in industrial plants, offices and apartments in apartment houses. They help minimize operating costs and facilitate cost assignment.

E-counter with LCD display

- 1 Large-format 7-digit LCD 8 × 4 mm
- 2 IR readout interface for mounting the readout measuring head
- 3 Display button
- 4 IR test output LED (10 IMP/W)
- 5 Sealable Set/Reset button

Readout data for consumption analysis

Manual readout

The above data can be called up and manually displayed directly on the E-counter by pressing buttons 5) Set/Reset button and 3) Display button. The E-counter calculates the consumption costs when the price per kWh has been entered. The ability to input the device number facilitates assignment to a number system and cost assignment to one of the various cost centers.

Readout software for the IR measuring head

The data of the above table are read into a PC using the magnetic IR measuring head and stored in an ASCII file according to IEC 61107.

This ASCII file can be further processed in an Excel or Access file.

The product range can be run under Windows 95, 98 and Windows NT.

Instantaneous p.f.	phase L1/L2/L3	p.f.	--
Instantaneous frequency		Hz	--
Device number, adjustable		No.	x

x = data are displayed

Data transmission instabus KNX EIB

The 7KT1 162 and 7KT1 165 counters are intended for the following data transmission:

- Active energy (kWh) rate 1
- Active energy (kWh) rate 2
- Device number
- Active power (kW) phase L1
- Active power (kW) phase L2
- Active power (kW) phase L3

Visualization software "Recording of consumption data and maximum time analysis" (available soon)

The software can read out and assign counter readings, and prepare the data for accounting.

The system does not differentiate between counters that are read out manually or in online operation.

A maximum time analysis can be carried out over several days on the PC in online operation. Graphical analyses are also available.

Energy flow direction

Counting is only carried out in the specified energy flow direction. For counters with transformer connection, the energy flow direction of the transformer (primary and secondary) as well as the correct assignment of the voltage and current paths must be taken into account.

Benefits

- The devices have accuracy class 2. This enables extremely precise energy measurements.
- The large LCD for the reading out of all data locally makes for easy reading.

Overview

This 3-phase current transformer can be used in distribution boards according to DIN 43880. The measuring leads are routed vertically through the standard mounting rail. With this type of construction, the current transformer is suitable for supply systems or outgoing cables in connection with the installation of a 5TE8 switch or a 5TE1 disconnector as the primary connecting leads do not have to be interrupted. The current transformer is designed for cables of up to 13 mm in diameter, e.g. H07V-R with 50 mm² conductor cross-section.

Benefits

- The current transformer has an accuracy class 1 according to EN 60044-1. This value is better than most measuring devices in this area of application.
- The versions designed for a transformer ratio of 60/5 A, 100/5 A and 150/5 A enable an even broader range of applications.

Measuring selector switches

Overview

Measuring selector switches are used as CO contacts of the phases for voltages and currents in 3-phase systems for voltmeters and ammeters.

The design of these switches is adapted to match the modular installation devices. They support use according to EN 60947-3.

Benefits

- The devices have a rated insulation voltage of 660 V. This permits use in many systems.

BETA Measuring Single-Phase Measuring Devices

E-counters
Digital measuring devices

Overview

E-counters serve the measurement of kWh in single-phase systems, e.g. in industrial plants, offices and apartments in apartment houses.

Benefits

- The accuracy class 2 according to IEC 62053-11 ensures that you always have the correct measured value
- The drum-type register in size 4 x 1.2 mm enables easy reading
- The short-circuit resistant pulse output protects the device if it is assembled incorrectly.

Overview

These devices for measuring voltages and currents can be used for monitoring input and output currents or device currents in electric plants. They are suitable for direct connection in a single-phase system or for three-phase systems when used in conjunction with a measuring selector switch.

The measuring ranges of the ammeter are set at the device with a coding switch.

Benefits

- The ammeters have 14 measuring ranges from 0 ... 20 A to 0 ... 999 A, which can be set using a coding switch. This ensures universal application.

Overview

These devices for measuring voltages and currents can be used for monitoring input and output currents or device currents in electric plants. They are suitable for direct connection in a single-phase system or for three-phase systems when used in conjunction with a measuring selector switch.

Benefits

- The 7KT1 020 ammeters can be equipped with changeable scales for primary currents of 60, 150 or 400 A AC, depending on the transformer ratio of the installed current transformer. The changeable scales are included in delivery. This ensures universal application.
- Permanent overload up to 20 % does not damage the device. Protection for your plant.

BETA Measuring Single-Phase Measuring Devices

Time and pulse counters

Overview

Time and pulse counters are used for the reliable monitoring of production and service times, which enables the exact planning and monitoring of production sequences, maintenance cycles and warranty times.

As well as the proven electromechanical time and pulse counters for mounting in distribution boards, we also supply digital time and pulse counters.

The fields of application for both counter types are very diverse, such as the recording of operating hours of machines, systems or building management systems, as well as pulse counting for general volume flow counting, registration of starting frequencies, starting cycles or production quantities in systems and machines.

Benefits

- Time and pulse counters help to plan maintenance intervals and ensure high plant availability.
- Versions without zero position and with electric or manual zero position for all applications
- Flexible application of the digital counters for supply voltages of 12-150 V DC and 24-240 V AC in a single device.

More information

Time counters count the time in hours with an accuracy of two decimal places (hundredths of hours). The pulse counter adds the number of pulses, e.g. the making operations of devices.

A power supply is required at terminals 1 and 3 of the electronic counters so that the device can constantly display the measured values. Once terminal 3 is supplied with voltage (for DC "+"), the counting procedure starts. If terminal 4 is supplied short-time with voltage (for DC "+"), the counter is reset.

In the case of electronic counters, the counting result is saved indefinitely in the event of a voltage failure (EEPROM). On recovery of the power, the counting is continued from the saved value. As well as a modern design, the electronic counter has a 7-digit LCD, which can be reset electrically or manually.

Time counters for front-panel mounting

Overview

Time and pulse counters for control cabinets, control and mechanical engineering are used, e.g. in boilers, machine tools or compressors. The pulse counters count the starting frequencies. This supports planning for preventative maintenance.

In-time and regular maintenance is the best protection against unexpected shutdowns. Time counters count the time in hours with an accuracy of two decimal places (hundredths of hours).

Benefits

- Time and pulse counters help to plan maintenance intervals and ensures high plant availability.
