### Description

The HCPL-3120 contains a GaAsP LED while the HCPL-J312 and the HCNW3120 contain an AlGaAs LED. The LED is optically coupled to an integrated circuit with a power output stage. These optocouplers are ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and current supplied by these optocouplers make them ideally suited for directly driving IGBTs with ratings up to 1200 V/100 A. For IGBTs with higher ratings, the HCPL-3120 series can be used to drive a discrete power stage which drives the IGBT gate. The HCNW3120 has the highest insulation voltage of  $V_{IORM}=1414V_{peak}$  in the IEC/EN/DIN EN 60747-5-5. The HCPL-J312 has an insulation voltage of  $V_{IORM} = 1230V_{peak}$  and the  $V_{IORM} = 630V_{peak}$  is also available with the HCPL-3120 (Option 060).

**CAUTION** It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

### Features

- 2.5 A maximum peak output current
- 2.0 A minimum peak output current
- 25 kV/ $\mu$ s minimum Common Mode Rejection (CMR) at  $V_{CM} = 1500$  V
- 0.5 V maximum low level output voltage ( $V_{OL}$ ) Eliminates need for negative gate drive
- $I_{CC} = 5$  mA maximum supply current
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- Wide operating VCC range: 15 to 30 Volts
- 500 ns maximum switching speeds
- Industrial temperature range:  $-40^{\circ}\text{C}$  to  $100^{\circ}\text{C}$
- Safety Approval:

#### UL Recognized

- 3750 Vrms for 1 min. for HCPL-3120/J312
- 5000 Vrms for 1 min. for HCNW3120

#### CSA Approval

#### IEC/EN/DIN EN 60747-5-5 Approved:

- $V_{IORM} = 630 V_{peak}$  for HCPL-3120 (Option 060)
- $V_{IORM} = 1230 V_{peak}$  for HCPL-J312
- $V_{IORM} = 1414 V_{peak}$  for HCNW3120

### Applications

- IGBT/MOSFET gate drive
- AC/Brushless DC motor drives
- Industrial inverters
- Switch mode power supplies

Functional Diagram

Truth Table

LED	$V_{CC} - V_{EE}$ "POSITIVE GOING" (i.e., TURN-ON)	$V_{CC} - V_{EE}$ "NEGATIVE GOING" (i.e., TURN-OFF)	$V_O$
OFF	0–30 V	0–30 V	LOW
ON	0–11 V	0–9.5 V	LOW
ON	11 –13.5 V	9.5–12 V	TRANSITION
ON	13.5–30 V	12–30 V	HIGH

A 0.1  $\mu$ F bypass capacitor must be connected between pins 5 and 8.

Selection Guide

Part Number	HCPL-3120	HCPL-J312	HCNW3120	HCPL-3150 <sup>a</sup>
Output Peak Current ( $I_O$ )	2.5 A	2.5 A	2.5 A	0.6 A
IEC/EN/DIN EN 60747-5-5 Approval	$V_{IORM}=630 V_{peak}$ (Option 060)	$V_{IORM}=1230 V_{peak}$	$V_{IORM}=1414 V_{peak}$	$V_{IORM}=630 V_{peak}$ (Option 060)

a. The HCPL-3150 Data sheet available. Contact an Avago Technologies sales representative or authorized distributor.

## Ordering Information

HCPL-3120 and HCPL-J312 are UL recognized with 3750 Vrms for 1 minute per UL1577. HCNW3120 is UL Recognized with 5000 Vrms for 1 minute per UL1577.

Part	Option		Package	Surface Mount	Gull Wing	Tape and Reel	IEC/EN/DIN Number	Quantity
	RoHS Compliant	Non RoHS Compliant						
HCPL-3120	-000E	No option	300-mil, DIP-8					50 per tube
	-300E	#300		X	X			50 per tube
	-500E	#500		X	X	X		1000 per reel
	-060E	#060					X	50 per tube
	-360E	#360		X	X		X	50 per tube
	-560E/PE	#560		X	X	X	X	1000 per tube
HCPL-J312	-000E	No option	300-mil, DIP-8				X	50 per tube
	-300E	#300		X	X		X	50 per tube
	-500E	#500		X	X	X	X	1000 per reel
HCNW3120	-000E	No option	400-mil, DIP-8				X	42 per tube
	-300E	#300		X	X		X	42 per tube
	-500E	#500		X	X	X	X	750 per reel

**NOTE** The notation '#XXX' is used for older products, while products launched since 15th July 2001 and RoHS compliant option will use '-XXxE'.

To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry.

Example 1:

HCPL-3120-560E to order product of 300 mil DIP Gull Wing Surface Mount package in Tape and Reel packaging with IEC/EN/DIN EN 60747-5-5 Safety Approval in RoHS compliant.

Example 2:

HCPL-3120 to order product of 300 mil DIP package in tube packaging and non RoHS compliant.

Option data sheets are available. Contact your Avago Technologies sales representative or authorized distributor for information.

## Package Outline Drawings

### HCPL-3120 Outline Drawing (Standard DIP Package)

## HCPL-3120 Gull Wing Surface Mount Option 300 Outline Drawing

DIMENSIONS IN MILLIMETERS (INCHES).

LEAD COPLANARITY =  $0.10$  mm ( $0.004$  INCHES).

NOTE: FLOATING LEAD PROTRUSION IS  $0.25$  mm ( $10$  mils) MAX.

## HCPL-J312 Outline Drawing (Standard DIP Package)

## HCPL-J312 Gull Wing Surface Mount Option 300 Outline Drawing

DIMENSIONS IN MILLIMETERS (INCHES).  
LEAD COPLANARITY = 0.10 mm (0.004 INCHES).

NOTE: FLOATING LEAD PROTRUSION IS 0.5 mm (20 mils) MAX.

## Insulation and Safety Related Specifications

Parameter	Symbol	Value			Units	Conditions
		HCPL-3120	HCPL-J312	HCNW3120		
Minimum External Air Gap (Clearance)	L(101)	7.1	7.4	9.6	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Tracking (Creepage)	L(102)	7.4	8.0	10.0	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	0.5	1.0	mm	Insulation thickness between emitter and detector; also known as distance through insulation.
Tracking Resistance (Comparative Tracking Index)	CTI	>175	>175	>200	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group		IIIa	IIIa	IIIa		Material Group (DIN VDE 0110, 1/89, Table 1)

All Avago Technologies data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered. There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

## IEC/EN/DIN EN 60747-5-5 Insulation Related Characteristics

Description	Symbol	HCPL-3120 Option 060	HCPL-J312	HCNW3120	Unit
Installation classification per DIN VDE 0110/1.89, Table 1  for rated mains voltage 150 V rms for rated mains voltage 300 V rms for rated mains voltage 450 V rms for rated mains voltage 600 V rms for rated mains voltage 1000 V rms		I-IV I-IV I-III	I-IV I-IV I-III I-III	I-IV I-IV I-IV I-IV I-III	
Climatic Classification		55/100/21	55/100/21	55/100/21	
Pollution Degree (DIN VDE 0110/1.89)		2	2	2

Low Level Output Voltage	$V_{OL}$			0.1	0.5	V	$I_O = 100\text{ mA}$	4, 6, 20	
High Level Supply Current	$I_{CCH}$			2.5	5.0	mA	Output Open, $I_F = 7$ to $16\text{ mA}$	7, 8	
Low Level Supply Current	$I_{CCL}$			2.5	5.0	mA	Output Open, $V_F = -3.0$ to $+0.8\text{ V}$		
Threshold Input Current Low to High	$I_{FLH}$	HCPL-3120		2.3	5.0	mA	$I_O = 0\text{ mA}$ , $V_O > 5\text{ V}$	9, 15,	
		HCPL-J312		1.0				21	
		HCNW3120		2.3	8.0				
Threshold Input Voltage High to Low	$V_{FHL}$		0.8			V			
Input Forward Voltage	$V_F$	HCPL-3120	1.2	1.5	1.8	V	$I_F = 10\text{ mA}$	16	
		HCPL-J312		1.6	1.95				
		HCNW3120							
Temperature Coefficient of Forward Voltage	$\Delta V_F / \Delta T_A$	HCPL-3120		-1.6		mV/ $^{\circ}\text{C}$	$I_F = 10\text{ mA}$		
		HCPL-J312		-1.3					
		HCNW3120							
Input Reverse Breakdown Voltage	$BV_R$	HCPL-3120	5			V	$I_R = 10\text{ }\mu\text{A}$		
		HCPL-J312	3				$I_R = 100\text{ }\mu\text{A}$		
		HCNW3120							
Input Capacitance	$C_{IN}$	HCPL-3120		60		pF	$f = 1\text{ MHz}$ , $V_F = 0\text{ V}$		
		HCPL-J312		70					
		HCNW3120							
UVLO Threshold	$V_{UVLO+}$		11.0	12.3	13.5	V	$V_O > 5\text{ V}$ , $I_F = 10\text{ mA}$	22, 34	
	$V_{UVLO-}$		9.5	10.7	12.0				
UVLO Hysteresis	$UVLO_{HYS}$			1.6					

- All typical values at  $T_A = 25\text{ }^{\circ}\text{C}$  and  $V_{CC} - V_{EE} = 30\text{ V}$ , unless otherwise notes.
- Maximum pulse width =  $50\text{ }\mu\text{s}$ , maximum duty cycle = 0.5%.
- Maximum pulse width =  $10\text{ }\mu\text{s}$ , maximum duty cycle = 0.2%. This value is intended to allow for component tolerances for designs with  $I_O$  peak minimum =  $2.0\text{ A}$ . See Applications section for additional details on limiting  $I_{OH}$  peak.
- In this test,  $V_{OH}$  is measured with a dc load current. When driving capacitive loads  $V_{OH}$  will approach  $V_{CC}$  as  $I_{OH}$  approaches zero amps.
- Maximum pulse width =  $1\text{ ms}$ , maximum duty cycle = 20%.

## Switching Specifications (AC)

Over recommended operating conditions ( $T_A = -40$  to  $100$  °C, for HCPL-3120, HCPL-J312  $I_{F(ON)} = 7$  to  $16$  mA, for HCNW3120  $I_{F(ON)} = 10$  to  $16$  mA,  $V_{F(OFF)} = -3.6$  to  $0.8$  V,  $V_{CC} = 15$  to  $30$  V,  $V_{EE} = \text{Ground}$ ) unless otherwise specified.

Parameter	Symbol	Min.	Typ. <sup>a</sup>	Max.	Units	Test Conditions	Fig.	Note
Propagation Delay Time to High Output Level	$t_{PLH}$	0.10	0.30	0.50	$\mu\text{s}$	$R_g = 10 \Omega$ , $C_g = 10 \text{ nF}$ , $f = 10 \text{ kHz}$ , Duty Cycle = 50%	10, 11, 12, 13, 14, 23	b
Propagation Delay Time to Low Output Level	$t_{PHL}$	0.10	0.30	0.50	$\mu\text{s}$			
Pulse Width Distortion	PWD			0.3	$\mu\text{s}$			
Propagation Delay Difference Between Any Two Parts	PDD ( $t_{PHL} - t_{PLH}$ )	-0.35		0.35	$\mu\text{s}$		35, 36	d
Rise Time	$t_r$		0.1		$\mu\text{s}$		23	
Fall Time	$t_f$		0.1		$\mu\text{s}$			
UVLO Turn On Delay	$t_{UVLO\ ON}$		0.8		$\mu\text{s}$	$V_O > 5 \text{ V}$ , $I_F = 10 \text{ mA}$	22	
UVLO Turn Off Delay	$t_{UVLO\ OFF}$		0.6			$V_O < 5 \text{ V}$ , $I_F = 10 \text{ mA}$		
Output High Level Common Mode Transient Immunity	$ CM_H $	25	35		kV/ $\mu\text{s}$	$T_A = 25^\circ\text{C}$ , $I_F = 10$ to $16 \text{ mA}$ , $V_{CM} = 1500 \text{ V}$ , $V_{CC} = 30 \text{ V}$	24	e, f
Output Low Level Common Mode Transient Immunity	$ CM_L $	25	35		kV/ $\mu\text{s}$	$T_A = 25^\circ\text{C}$ , $V_{CM} = 1500 \text{ V}$ , $V_F = 0 \text{ V}$ , $V_{CC} = 30 \text{ V}$		e, g

- All typical values at  $T_A = 25$  °C and  $V_{CC} - V_{EE} = 30 \text{ V}$ , unless otherwise noted.
- This load condition approximates the gate load of a 1200 V/75A IGBT.
- Pulse Width Distortion (PWD) is defined as  $|t_{PHL} - t_{PLH}|$  for any given device.
- The difference between  $t_{PHL}$  and  $t_{PLH}$  between any two HCPL-3120 parts under the same test condition.
- Pins 1 and 4 need to be connected to LED common.
- Common mode transient immunity in the high state is the maximum tolerable  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in the high state (i.e.,  $V_O > 15.0 \text{ V}$ ).
- Common mode transient immunity in a low state is the maximum tolerable  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a low state (i.e.,  $V_O < 1.0 \text{ V}$ ).

## Package Characteristics

Over recommended temperature ( $T_A = -40$  to  $100\text{ }^{\circ}\text{C}$ ) unless otherwise specified.

Parameter	Symbol	Device	Min.	Typ. <sup>a</sup>	Max.	Units	Test Conditions	Fig.	Note

LED-to-Case Thermal Resistance	$\theta_{LC}$			467		$^{\circ}\text{C/W}$	Thermocouple located at center underside of package	28	
LED-to-Detector Thermal Resistance	$\theta_{LD}$			442		$^{\circ}\text{C/W}$			
Detector-to-Case Thermal Resistance	$\theta_{DC}$			126		$^{\circ}\text{C/W}$			

- All typicals at  $T_A = 25\text{ }^{\circ}\text{C}$ .
- The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to your equipment level safety specification or Broadcom Ltd. Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 4500 V_{rms}$  for 1 second (leakage detection current limit,  $I_{I-O} \leq 5\text{ }\mu\text{A}$ ).
- Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 4500 V_{rms}$  for 1 second (leakage detection current limit,  $I_{I-O} \leq 5\text{ }\mu\text{A}$ ).
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 6000 V_{rms}$  for 1 second (leakage detection current limit,  $I_{I-O} \leq 5\text{ }\mu\text{A}$ ).

## Application Information

### Eliminating Negative IGBT Gate Drive (Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)

To keep the IGBT firmly off, the HCPL-3120 has a very low maximum  $V_{OL}$  specification of 0.5V. The HCPL-3120 realizes this very low  $V_{OL}$  by using a DMOS transistor with 1 (typical)  $\Omega$  resistance in its pull down circuit. When the HCPL-3120 is in the low state, the IGBT gate is shorted to the emitter by  $R_g + 1$ . Minimizing  $R_g$  and the lead inductance from the HCPL-3120 to the IGBT gate and emitter (possibly by mounting the HCPL-3120 on a small PC board directly above the IGBT) can eliminate the need for negative IGBT gate drive in many applications as shown in Figure 25. Care should be taken with such a PC board design to avoid routing the IGBT collector or emitter traces close to the HCPL-3120 input as this can result in unwanted coupling of transient signals into the HCPL-3120 and degrade performance. (If the IGBT drain must be routed near the HCPL-3120 input, then the LED should be reverse-biased when in the off state, to prevent the transient signals coupled from the IGBT drain from turning on the HCPL-3120.)

**Figure 25 Recommended LED Drive and Application Circuit**

Selecting the Gate Resistor ( $R_g$ ) to Minimize IGBT Switching Losses. (Discussion applies to HCPL-3120, HCPL-J312 and HCNW3120)

Step 1: Calculate  $R_g$  Minimum from the  $I_{OL}$  Peak Specification. The IGBT and  $R_g$  in Figure 26 can be analyzed as a simple RC circuit with a voltage supplied by the HCPL-3120.

$$\begin{aligned} R_g &\geq (V_{CC} - V_{EE} - V_{OL}) / I_{OLPEAK} \\ &= (V_{CC} - V_{EE} - 2V) / I_{OLPEAK} \\ &= (15V + 5V - 2V) / 2.5A \\ &= 7.2 \Omega \approx 8 \Omega \end{aligned}$$

The  $V_{OL}$  value of 2V in the previous equation is a conservative value of  $V_{OL}$  at the peak current of 2.5A (see Figure 6). At lower  $R_g$  values the voltage supplied by the HCPL-3120 is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used  $V_{EE}$  in the previous equation is equal to zero volts.

Step 2: Check the HCPL-3120 Power Dissipation and Increase  $R_g$  if Necessary. The HCPL-3120 total power dissipation ( $P_T$ ) is equal to the sum of the emitter power ( $P_E$ ) and the output power ( $P_O$ ):

$$\begin{aligned} P_T &= P_E + P_O \\ P_E &= I_F \times V_F \times \text{Duty Cycle} \\ P_O &= P_{O(BIAS)} + P_{O(SWITCHING)} \\ &= I_{CC} \times (V_{CC} - V_{EE}) + E_{SW}(R_g, Q_g) \times f \end{aligned}$$

For the circuit in Figure 26 with  $I_F$  (worst case) = 16mA,  $R_g = 8 \Omega$ , Max Duty Cycle = 80%,  $Q_g = 500 \text{ nC}$ ,  $f = 20 \text{ kHz}$  and  $T_A \text{ max} = 85^\circ\text{C}$ :

$$\begin{aligned} P_E &= 16 \text{ mA} \times 1.8 \text{ V} \times 0.8 = 23 \text{ mW} \\ P_O &= 4.25 \text{ mA} \times 20 \text{ V} + 5.2 \mu\text{J} \times 20 \text{ kHz} \\ &= 85 \text{ mW} + 104 \text{ mW} \\ &= 189 \text{ mW} > 178 \text{ mW} (P_{O(MAX)} @ 85^\circ\text{C}) \\ &= 250 \text{ mW} - 15^\circ\text{C} \times 4.8 \text{ mW}/^\circ\text{C} \end{aligned}$$

The value of 4.25 mA for  $I_{CC}$  in the previous equation was obtained by derating the  $I_{CC}$  max of 5 mA (which occurs at  $-40^\circ\text{C}$ ) to  $I_{CC}$  max at  $85^\circ\text{C}$  (see Figure 7).

Since  $P_O$  for this case is greater than  $P_{O(MAX)}$ ,  $R_g$  must be increased to reduce the HCPL-3120 power dissipation.

$$\begin{aligned} P_{O(SWITCHING MAX)} &= P_{O(MAX)} - P_{O(BIAS)} \\ &= 178 \text{ mW} - 85 \text{ mW} \\ &= 93 \text{ mW} \\ E_{SW(MAX)} &= (P_{O(SWITCHING MAX)}) / f \\ &= 93 \text{ mW} / 20 \text{ kHz} = 4.65 \mu\text{J} \end{aligned}$$

For  $Q_g = 500 \text{ nC}$ , from Figure 27, a value of  $E_{SW} = 4.65 \mu\text{J}$  gives an  $R_g = 10.3 \Omega$ .

## Thermal Model (Discussion applies to HCPL-3120, HCPL-J312 and HCNW3120)

The steady state thermal model for the HCPL-3120 is shown in [Figure 28](#). The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. As shown by the model, all heat generated flows through  $\theta_{CA}$  which raises the case temperature  $T_C$  accordingly. The value of  $\theta_{CA}$  depends on the conditions of the board design and is, therefore, determined by the designer. The value of  $\theta_{CA} = 83^\circ\text{C/W}$  was obtained from thermal measurements using a  $2.5 \times 2.5$  inch PC board, with small traces (no ground plane), a single HCPL-3120 soldered into the center of the board and still air. The absolute maximum power dissipation derating specifications assume a  $\theta_{CA}$  value of  $83^\circ\text{C/W}$ .

From the thermal mode in [Figure 28](#), the LED and detector IC junction temperatures can be expressed as:

$$T_{JE} = P_E \approx (\theta_{LC} \| (\theta_{LD} + \theta_{DC}) + \theta_{CA}) \\ + P_D \times (((\theta_{LC} \times \theta_{DC}) / (\theta_{LC} + \theta_{DC} + \theta_{LD})) + \theta_{CA}) + T_A$$

$$T_{JD} = P_E ((\theta_{LC} \times \theta_{DC}) / (\theta_{LC} + \theta_{DC} + \theta_{LD})) + \theta_{CA} \\ + P_D \times (\theta_{DC} \| (\theta_{LD} + \theta_{LC}) + \theta_{CA}) + T_A$$

Inserting the values for  $\theta_{LC}$  and  $\theta_{DC}$  shown in [Figure 28](#) gives:

$$T_{JE} = P_E \times (256^\circ\text{C/W} + \theta_{CA}) \\ + P_D \cdot (57^\circ\text{C/W} + \theta_{CA}) + T_A$$

$$T_{JD} = P_E \times (57^\circ\text{C/W} + \theta_{CA}) \\ + P_D \times (111^\circ\text{C/W} + \theta_{CA}) + T_A$$

For example, given  $P_E = 45\text{ mW}$ ,  $P_D = 250\text{ mW}$ ,  $T_A = 70^\circ\text{C}$ , and  $\theta_{CA} = 83^\circ\text{C/W}$ :

$$T_{JE} = P_E \times 339^\circ\text{C/W} + P_D \times 140^\circ\text{C/W} + T_A \\ = 45\text{ mW} \times 339^\circ\text{C/W} + 250\text{ mW} \\ \times 140^\circ\text{C/W} + 70^\circ\text{C} = 120^\circ\text{C}$$

$$T_{JD} = P_E \times 140^\circ\text{C/W} + P_D \times 194^\circ\text{C/W} + T_A \\ = 45\text{ mW} \times 140^\circ\text{C/W} + 250\text{ mW} \times 194^\circ\text{C/W} + 70^\circ\text{C} = 125^\circ\text{C}$$

$T_{JE}$  and  $T_{JD}$  should be limited to  $125^\circ\text{C}$  based on the board layout and part placement ( $\theta_{CA}$ ) specific to the application.

$P_E$ Parameter	Description
$I_F$	LED Current
$V_F$	LED On Voltage
Duty Cycle	Maximum LED Duty Cycle

$P_O$ Parameter	Description
$I_{CC}$	Supply Current
$V_{CC}$	Positive Supply Voltage
$V_{EE}$	Negative Supply Voltage
$E_{SW}(R_g, Q_g)$	Energy Dissipated in the HCPL-3120 for each IGBT Switching Cycle (see <a href="#">Figure 27</a> )
$f$	Switching Frequency

## LED Drive Circuit Considerations for Ultra High CMR Performance

(Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)

Without a detector shield, the dominant cause of optocoupler CMR failure is capacitive coupling from the input side of the optocoupler, through the package, to the detector IC as shown in [Figure 29](#). The HCPL-3120 improves CMR performance by using a detector IC with an optically transparent Faraday shield, which diverts the capacitively coupled current away from the sensitive IC circuitry. However, this shield does not eliminate the capacitive coupling between the LED and optocoupler pins 5–8 as shown in [Figure 30](#). This capacitive coupling causes perturbations in the LED current during common mode transients and becomes the major source of CMR failures for a shielded optocoupler. The main design objective of a high CMR LED drive circuit becomes keeping the LED in the proper state (on or off) during common mode transients. For example, the recommended application circuit ([Figure 25](#)), can achieve  $25\text{ kV}/\mu\text{s}$  CMR while minimizing component complexity.

Techniques to keep the LED in the proper state are discussed in the next two sections.

**Figure 29 Optocoupler Input to Output Capacitance Model for Unshielded Optocouplers**

**Figure 30 Optocoupler Input to Output Capacitance Model for Shielded Optocouplers**

## CMR with the LED On ( $CMR_H$ )

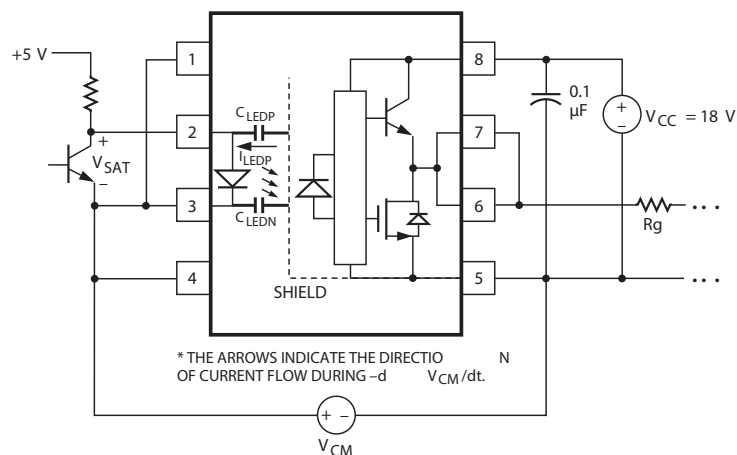

A high CMR LED drive circuit must keep the LED on during common mode transients. This is achieved by overdriving the LED current beyond the input threshold so that it is not pulled below the threshold during a transient. A minimum LED current of 10 mA provides adequate margin over the maximum  $I_{FLH}$  of 5 mA to achieve 25 kV/ $\mu$ s CMR.

## CMR with the LED Off ( $CMR_L$ )

A high CMR LED drive circuit must keep the LED off ( $V_F \leq V_{F(OFF)}$ ) during common mode transients. For example, during a  $-dV_{cm}/dt$  transient in Figure 31, the current flowing through  $C_{LEDP}$  also flows through the  $R_{SAT}$  and  $V_{SAT}$  of the logic gate. As long as the low state voltage developed across the logic gate is less than  $V_{F(OFF)}$ , the LED will remain off and no common mode failure will occur.

The open collector drive circuit, shown in Figure 32, cannot keep the LED off during a  $+dV_{cm}/dt$  transient, since all the current flowing through  $C_{LEDN}$  must be supplied by the LED, and it is not recommended for applications requiring ultra high CMRL performance. Figure 33 is an alternative drive circuit which, like the recommended application circuit (Figure 25), does achieve ultra high CMR performance by shunting the LED in the off state.

**Figure 31** Equivalent Circuit for Figure 25 During Common Mode Transient

**Figure 32** Not Recommended Open Collector Drive Circuit

**Figure 33** Recommended LED Drive Circuit for Ultra-High CMR

**Figure 34** Under Voltage Lock Out

## Under Voltage Lockout Feature

(Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)

The HCPL-3120 contains an under voltage lockout (UVLO) feature that is designed to protect the IGBT under fault conditions which cause the HCPL-3120 supply voltage (equivalent to the fully-charged IGBT gate voltage) to drop below a level necessary to keep the IGBT in a low resistance state. When the HCPL-3120 output is in the high state and the supply voltage drops below the HCPL-3120  $V_{UVLO-}$  threshold ( $9.5 < V_{UVLO-} < 12.0$ ) the optocoupler output will go into the low state with a typical delay, UVLO Turn Off Delay, of 0.6  $\mu$ s.

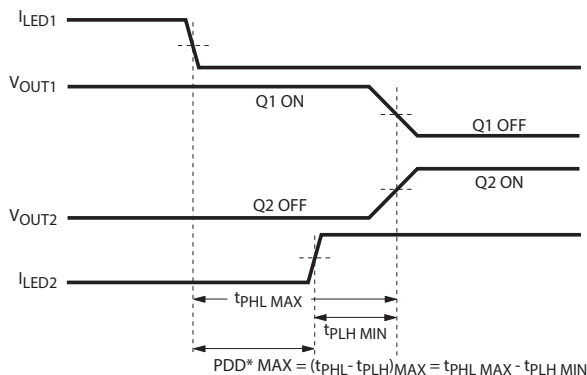

When the HCPL-3120 output is in the low state and the supply voltage rises above the HCPL-3120  $V_{UVLO+}$  threshold ( $11.0 < V_{UVLO+} < 13.5$ ) the optocoupler output will go into the high state (assumes LED is "ON") with a typical delay, UVLO Turn On Delay of 0.8  $\mu$ s.

## IPM Dead Time and Propagation Delay Specifications

(Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)

The HCPL-3120 includes a Propagation Delay Difference (PDD) specification intended to help designers minimize "dead time" in their power inverter designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 25) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices between the high and low voltage motor rails.

**Figure 35 Minimum LED Skew for Zero Dead Time**

\*PDD = PROPAGATION DELAY DIFFERENCE  
NOTE: FOR PDD CALCULATIONS THE PROPAGATION DELAYS ARE TAKEN AT THE SAME TEMPERATURE AND TEST CONDITIONS.

**Figure 36 Waveforms for Dead Time**

\*PDD = PROPAGATION DELAY DIFFERENCE  
NOTE: FOR DEAD TIME AND PDD CALCULATIONS ALL PROPAGATION DELAYS ARE TAKEN AT THE SAME TEMPERATURE AND TEST CONDITIONS.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 35. The amount of delay necessary to achieve this conditions is equal to the maximum value of the propagation delay difference specification,  $PDD_{\text{MAX}}$ , which is specified to be 350 ns over the operating temperature range of  $-40^\circ\text{C}$  to  $100^\circ\text{C}$ .

Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the maximum and minimum propagation delay difference specifications as shown in Figure 36. The maximum dead time for the HCPL-3120 is 700ns ( $= 350\text{ns} - (-350\text{ns})$ ) over an operating temperature range of  $-40^\circ\text{C}$  to  $100^\circ\text{C}$ .

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical IGBTs.
