**Description**

The SMA4F Transil series has been designed to protect sensitive equipment against electrostatic discharges according to IEC 61000-4-2, MIL STD 883 Method 3015, and electrical over stress such as IEC 61000-4-4 and 5. They are generally for surges below 400 W 10/1000 µs.

This planar technology makes it compatible with high-end equipment and SMPS where low leakage current and high junction temperature are required to provide reliability and stability over time. Their low clamping voltages provides a better safety margin to protect sensitive circuits with extended life time expectancy.

Packaged in SMAflat non exposed pad, this minimizes PCB space consumption (footprint in accordance with IPC 7531 standard).

1. Pulse test: $t_p < 50\text{ms}$.2. To calculate maximum clamping voltage at other surge currents, use the following formula
 $V_{CLmax} = R_D \times I_{PP} + V_{BRmax}$ 3. To calculate V_{BR} versus junction temperature, use the following formula:

$$V_{BR} @ T_j = V_{BR} @ 25^{\circ}\text{C} \times (1 + \alpha T \times (T_j - 25))$$
