Description

The TSX92x single and dual operational amplifiers (op-amps) offer excellent AC characteristics such as 10 MHz gain bandwidth, 17 V/ μ s slew rate, and 0.0003 % THD+N. These features make the TSX92x family particularly well-adapted for communications, I/V amplifiers for ADCs, and active filtering applications.

Their rail-to-rail input and output capability, while operating on a wide supply voltage range of 4 V to 16 V, allows these devices to be used in a wide range of applications. Automotive qualification is available as these devices can be used in this market segment.

Shutdown mode is available on the single (TSX920) and dual (TSX923) versions enabling an important current consumption reduction while this function is active.

The TSX92x family is available in SMD packages featuring a high level of integration. The DFN8 package, used in the TSX922, with a typical size of 2x2 mm and a maximum height of 0.8 mm offers even greater package size reduction.

Features

- Rail-to-rail input and output
- Wide supply voltage: 4 V - 16 V
- Gain bandwidth product: 10 MHz typ at 16 V
- Low power consumption: 2.8 mA typ per amplifier at 16 V
- Unity gain stable
- Low input bias current: 10 pA typ
- High tolerance to ESD: 4 kV HBM
- Extended temperature range: -40 °C to +125 °C
- Automotive qualification

4 Application information

4.1 Operating voltages

The TSX92x operational amplifiers can operate from 4 V to 16 V. The parameters are fully specified at 4.5 V, 10 V, and 16 V power supplies. However, parameters are very stable in the full V_{CC} range. Additionally, main specifications are guaranteed in the extended temperature range from -40 to +125 °C.

4.2 Rail-to-rail input

The TSX92x series is designed with two complementary PMOS and NMOS input differential pairs. The device has a rail-to-rail input and the input common mode range is extended from $(V_{CC-}) - 0.1$ V to $(V_{CC+}) + 0.1$ V. However, the performance of this device is clearly optimized for the PMOS differential pairs (which means from $(V_{CC-}) - 0.1$ V to $(V_{CC+}) - 2$ V).

Beyond $(V_{CC+}) - 2$ V, the operational amplifier is still functional but with downgraded performances (see [Figure 19](#)). Performances are still suitable for a large number of applications requiring the rail-to-rail input feature.

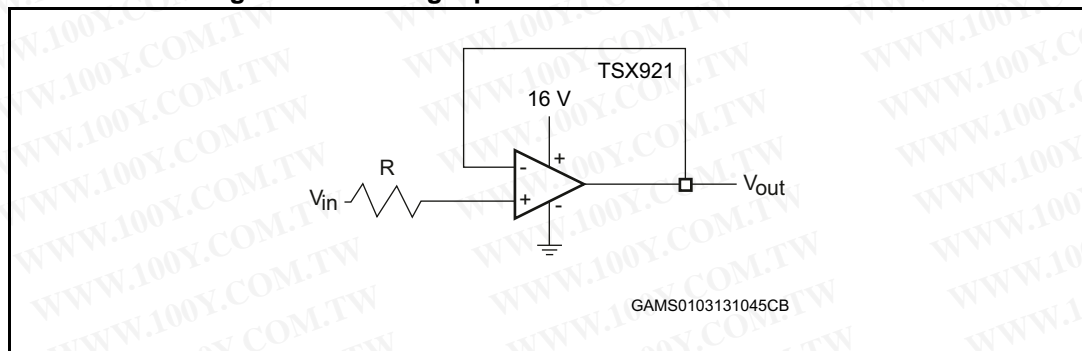

The TSX92x operational amplifiers are designed to prevent phase reversal.

4.3 Input pin voltage range

The TSX92x operational amplifiers have internal ESD diode protections on the inputs. These diodes are connected between the input and each supply rail to protect MOSFETs inputs from electrostatic discharges.

Thus, if the input pin voltage exceeds the power supply by 0.5 V, the ESD diodes become conductive and excessive current could flow through them. To prevent any permanent damage, this current must be limited to 10 mA. This can be done by adding a resistor in series with the input pin ([Figure 38](#)). The resistor value has to be calculated for a 10 mA current limitation on the input pins.

Figure 38. Limiting input current with a series resistor

4.4 Capacitive load

Driving a large capacitive load can cause stability issues. Increasing the load capacitance produces gain peaking in the frequency response, with overshooting and ringing in the step response. It is usually considered that with a gain peaking higher than 2.3 dB the op-amp might become unstable. Generally, the unity gain configuration is the worst configuration for stability and the ability to drive large capacitive loads. *Figure 39* shows the serial resistor (Riso) that must be added to the output, to make the system stable.

Figure 39. Stability criteria with a serial resistor

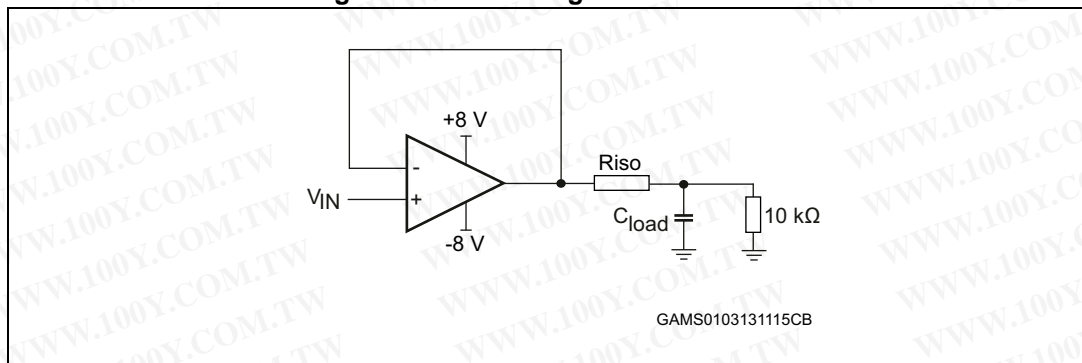

Figure 40. Test configuration for Riso

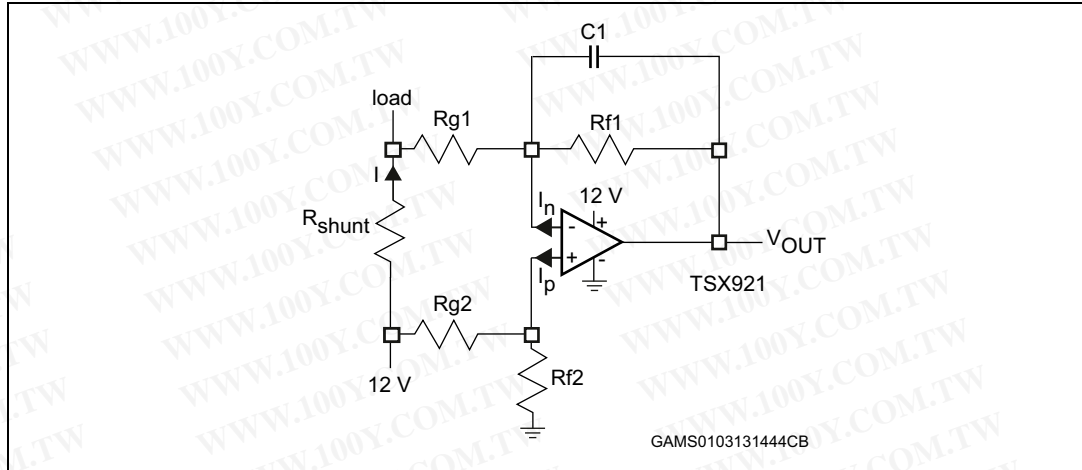

GAMS0103131115CB

4.5 High side current sensing

TSX92x rail to rail input devices can be used to measure a small differential voltage on a high side shunt resistor and translate it into a ground referenced output voltage. The gain is fixed by external resistance.

Figure 41. High side current sensing configuration

V_{OUT} can be expressed as shown in Equation 1.

Equation 1

$$V_{out} = R_{shunt} \times I \left(1 - \frac{R_{g2}}{R_{g2} + R_{f2}} \right) \left(1 + \frac{R_{f1}}{R_{g1}} \right) + I_p \left(\frac{R_{g2} R_{f2}}{R_{g2} + R_{f2}} \right) \times \left(1 + \frac{R_{f1}}{R_{g1}} \right) - I_n \times R_{f1} - V_{io} \left(1 + \frac{R_{f1}}{R_{g1}} \right)$$

Assuming that $R_{f2} = R_{f1} = R_f$ and $R_{g2} = R_{g1} = R_g$, Equation 1 can be simplified as Equation 2.

Equation 2

$$V_{out} = R_{shunt} \times I \left(\frac{R_f}{R_g} \right) - V_{io} \left(1 + \frac{R_f}{R_g} \right) + R_f \times I_{io}$$

With the TSX92x operational amplifiers, the high side current measurement must be made by respecting the common mode voltage of the amplifier: $(V_{CC-}) - 0.1 V$ to $(V_{CC+}) + 0.1 V$. If the application requires a higher common voltage please refer to the TSC high side current sensing family.

4.6 High speed photodiode

The TSX92x series is an excellent choice for current to voltage (I-V) conversions. Due to the CMOS technology, the input bias currents are extremely low. Moreover, the low noise and high unity-gain bandwidth of the TSX92x operational amplifiers make them particularly suitable for high-speed photodiode preamplifier applications.

The photodiode is considered as a capacitive current source. The input capacitance, C_{IN} , includes the parasitic input Common mode capacitance, C_{CM} (3pF), and the input differential mode capacitance, C_{DIFF} (8pF). C_{IN} acts in parallel with the intrinsic capacitance of the photodiode, C_D . At higher frequencies, the capacitors affect the circuit response. The output capacitance of a current sensor has a strong effect on the stability of the op-amp feedback loop.

C_F stabilizes the gain and limits the transimpedance bandwidth. To ensure good stability and to obtain good noise performance, C_F can be set as shown in [Equation 3](#).

Equation 3

$$C_F > \sqrt{\frac{C_{IN} + C_D}{2 \cdot \pi \cdot R_F \cdot F_{GBP}}} - C_{SMR}$$

where,

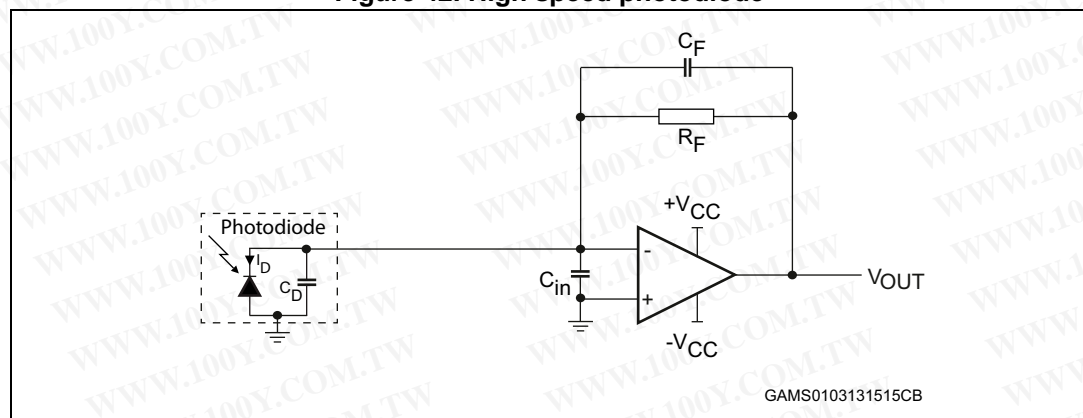

- $C_{IN} = C_{CM} + C_{DIFF} = 11$ pF
- C_{DIFF} is the differential input capacitance: 8 pF typical
- C_{CM} is the Common mode input capacitance: 3 pF typical
- C_D is the intrinsic capacitance of the photodiode
- C_{SMR} is the parasitic capacitance of the surface mount R_F resistor: 0.2 pF typical
- F_{GBP} is the gain bandwidth product: 10 MHz at 16 V

R_F fixes the gain as shown in [Equation 4](#).

Equation 4

$$V_{OUT} = R_F \times I_D$$

Figure 42. High speed photodiode

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

7 Revision history

Table 14. Document revision history

Date	Revision	Changes
12-Apr-2013	1	Initial release
27-Jun-2013	2	Added TSX920, TSX922, TSX923 devices. Added packages for TSX920, TSX922, and TSX923. Added shutdown characteristics in Table 4 , Table 5 , and Table 6 . Added Figure 35 , Figure 36 , and Figure 37 . Updated Table 13 for new order codes.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT AUTHORIZED FOR USE IN WEAPONS. NOR ARE ST PRODUCTS DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
