DESCRIPTION

The HCF4013B is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor technology available in DIP and SOP packages. The HCF4013B consists of two identical, independent data type flip-flops. Each flip-flop has independent data, set, reset, and clock inputs and

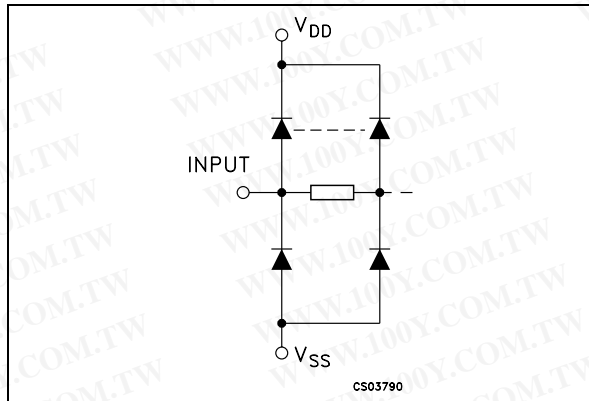

Q and \bar{Q} outputs. This device can be used for shift register applications, and, by connecting \bar{Q} output to the data input, for counter and toggle applications. The logic level present at the D input is transferred to the \bar{Q} output during the positive-going transition of the clock pulse. Setting or resetting is independent of the clock and is accomplished by a high level on the set or reset line, respectively
