## Notes:

- 1. Lead Form: GW Gull Wing, TH Through Hole.
- 2. Refer to product data sheet to confirm actual wire diameter.
- 3. 'ND' means None Detected, negligible amount present.
- \* This package may be remarked. If remarked, the package will contain additional homogeneous materials inksthat are not listed in contents of this report.
  - Material Reports
  - Material Safety Data Sheets (MSDS)

This part is qualified as lead-free.

Parts qualified as lead–free can be manufactured and supplied as lead–free, if and only if, the customer makes such requests to the Maxim Business Units for approval. The navigation bar on the EMMI website contains information regarding the lead–free process (e.g. MSL's, Peak reflow Temperatures, JEDEC methods, frequently asked questions and answers, lead–free package tables, and status/qualification plans for particular package types qualified as lead–free or in the qualification process).

This report was generated on 2011–05–30. For additional information, please visit the Maxim/Dallas Environmental Management and Materials Information website located at:

# DS1225AB/AD 64k Nonvolatile SRAM

#### www.maxim-ic.com

# **FEATURES**

- 10 years minimum data retention in the absence of external power
- Data is automatically protected during power loss
- Directly replaces 8k x 8 volatile static RAM or EEPROM
- Unlimited write cycles
- Low-power CMOS
- JEDEC standard 28-pin DIP package
- Read and write access times of 70 ns
- Lithium energy source is electrically disconnected to retain freshness until power is applied for the first time
- Full  $\pm 10\%$  V<sub>CC</sub> operating range (DS1225AD)
- Optional ±5% V<sub>CC</sub> operating range (DS1225AB)
- Optional industrial temperature range of -40°C to +85°C, designated IND

CE	- Chip Enable
$\overline{\text{WE}}$	- Write Enable
<del>OE</del>	- Output Enable
$V_{CC}$	- Power (+5V)
GND	- Ground

## DESCRIPTION

The DS1225AB and DS1225AD are 65,536-bit, fully static, nonvolatile SRAMs organized as 8192 words by 8 bits. Each NV SRAM has a self-contained lithium energy source and control circuitry which constantly monitors  $V_{CC}$  for an out-of-tolerance condition. When such a condition occurs, the lithium energy source is automatically switched on and write protection is unconditionally enabled to prevent data corruption. The NV SRAMs can be used in place of existing 8k x 8 SRAMs directly conforming to the popular bytewide 28-pin DIP standard. The devices also match the pinout of the 2764 EPROM and the 2864 EEPROM, allowing direct substitution while enhancing performance. There is no limit on the number of write cycles that can be executed and no additional support circuitry is required for microprocessor interfacing.

# **READ MODE**

The DS1225AB and DS1225AD execute a read cycle whenever WE (Write Enable) is inactive (high) and  $\overline{\text{CE}}$  (Chip Enable) and  $\overline{\text{OE}}$  (Output Enable) are active (low). The unique address specified by the 13 address inputs (A<sub>0</sub> -A<sub>12</sub>) defines which of the 8192 bytes of data is to be accessed. Valid data will be available to the eight data output drivers within  $t_{ACC}$  (Access Time) after the last address input signal is stable, providing that  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  access times are also satisfied. If  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  access times are not satisfied, then data access must be measured from the later-occurring signal and the limiting parameter is either  $t_{CO}$  for  $\overline{\text{CE}}$  or  $t_{OE}$  for  $\overline{\text{OE}}$  rather than address access.

# **WRITE MODE**

The DS1225AB and DS1225AD execute a write cycle whenever the WE and CE signals are active (low) after address inputs are stable. The later-occurring falling edge of  $\overline{CE}$  or  $\overline{WE}$  will determine the start of the write cycle. The write cycle is terminated by the earlier rising edge of  $\overline{CE}$  or  $\overline{WE}$ . All address inputs must be kept valid throughout the write cycle.  $\overline{WE}$  must return to the high state for a minimum recovery time ( $t_{WR}$ ) before another cycle can be initiated. The  $\overline{OE}$  control signal should be kept inactive (high) during write cycles to avoid bus contention. However, if the output drivers are enabled ( $\overline{CE}$  and  $\overline{OE}$  active) then  $\overline{WE}$  will disable the outputs in  $t_{ODW}$  from its falling edge.

# DATA RETENTION MODE

The DS1225AB provides full functional capability for  $V_{CC}$  greater than 4.75 volts and write protects by 4.5 volts. The DS1225AD provides full-functional capability for  $V_{CC}$  greater than 4.5 volts and write protects by 4.25 volts. Data is maintained in the absence of  $V_{CC}$  without any additional support circuitry. The nonvolatile static RAMs constantly monitor  $V_{CC}$ . Should the supply voltage decay, the NV SRAMs automatically write protect themselves, all inputs become "don't care," and all outputs become high-impedance. As  $V_{CC}$  falls below approximately 3.0 volts, the power switching circuit connects the lithium energy source to RAM to retain data. During power-up, when  $V_{CC}$  rises above approximately 3.0 volts, the power switching circuit connects external  $V_{CC}$  to RAM and disconnects the lithium energy source. Normal RAM operation can resume after  $V_{CC}$  exceeds 4.75 volts for the DS1225AB and 4.5 volts for the DS1225AD.

#### FRESHNESS SEAL

Each DS1225 is shipped from Maxim with the lithium energy source disconnected, guaranteeing full energy capacity. When  $V_{CC}$  is first applied at a level of greater than  $V_{TP}$ , the lithium energy source is enabled for battery backup operation.

# 勝 特 力 材 料 886-3-5753170 胜特力电子(上海) 86-21-34970699 胜特力电子(深圳) 86-755-83298787 Http://www.100y.com.tw

# **NOTES:**

- 1. WE is high for a read cycle.
- 2.  $\overline{OE} = V_{IH}$  or  $V_{IL}$ . If  $\overline{OE} = V_{IH}$  during write cycle, the output buffers remain in a high-impedance state.
- 3.  $t_{WP}$  is specified as the logical AND of  $\overline{CE}$  and  $\overline{WE}$ .  $t_{WP}$  is measured from the latter of  $\overline{CE}$  or  $\overline{WE}$  going low to the earlier of  $\overline{CE}$  or  $\overline{WE}$  going high.
- 4.  $t_{DS}$  are measured from the earlier of  $\overline{CE}$  or  $\overline{WE}$  going high.
- 5. These parameters are sampled with a 5 pF load and are not 100% tested.
- 6. If the  $\overline{\text{CE}}$  low transition occurs simultaneously with or later than the  $\overline{\text{WE}}$  low transition, the output buffers remain in a high-impedance state during this period.
- 7. If the  $\overline{\text{CE}}$  high transition occurs prior to or simultaneously with the  $\overline{\text{WE}}$  high transition, the output buffers remain in a high-impedance state during this period.
- 8. If  $\overline{\text{WE}}$  is low or the  $\overline{\text{WE}}$  low transition occurs prior to or simultaneously with the  $\overline{\text{CE}}$  low transition, the output buffers remain in a high-impedance state during this period.
- 9. Each DS1225AB and each DS1225AD has a built-in switch that disconnects the lithium source until  $V_{CC}$  is first applied by the user. The expected  $t_{DR}$  is defined as accumulative time in the absence of  $V_{CC}$  starting from the time power is first applied by the user. This parameter is guaranteed by design and is not 100% tested.
- 10. All AC and DC electrical characteristics are valid over the full operating temperature range. For commercial products, this range is 0°C to 70°C. For industrial products (IND), this range is -40°C to +85°C.
- 11. In a power down condition the voltage on any pin may not exceed the voltage on  $V_{\rm CC}$ .
- 12.  $t_{WR1}$ ,  $t_{DH1}$  are measured from  $\overline{WE}$  going high.
- 13.  $t_{WR2}$ ,  $t_{DH2}$  are measured from  $\overline{CE}$  going high.
- 14. DS1225 modules are recognized by Underwriters Laboratories (UL) under file E99151.
