GENERAL DESCRIPTION

The AD1984 family of audio codecs and SoundMAX® software provides superior High Definition audio quality that exceeds Vista Premium performance. The AD1984 has four 192 kHz DACs, four 192 kHz ADCs, S/PDIF output, a four-channel digital microphone interface, Digital Beep and analog PCBeep. These features make the AD1984 the right choice for desktop and notebook PCs where performance is key.

The AD1984 is available in a 48-lead, Pb-free frame chip scale package in both reels and trays. See [Ordering Guide on Page 20](#).

ADDITIONAL INFORMATION

HD-AUDIO LINK SPECIFICATION

High-definition audio signals comply with the High-definition Audio specification. Please refer to these specifications at: <http://www.intel.com/standards/hdaudio/>

POWER DOWN STATES

Parameter	ID _{VDD} Typ	IA _{VDD} Typ	Unit
Function node in D0, all nodes active	58	31	mA
Function node in D3 ¹	21	2	mA
Codec in $\overline{\text{RESET}}$	3	3	mA
Individual block power savings			
DAC pair powered down saves (each)	6	5	mA
ADC pair powered down saves (each)	5	3	mA
Mixer power control (and associated amps) saves	0	2	mA
DM_FLT pair powered down saves (each)	5	0	mA
DM_CLK powered down saves ²	0	1	mA
MIC_BIAS powered down saves ³	0	0.5	mA

¹ Function node D3 state powers down all nodes except for the V_{REF}, Mixer and MIC_BIAS nodes which have independent power controls. V_{REF} should be kept active when background functions such as jack presence detection or analog pass-through are required. Mixer should be kept active when analog pass-through is required. MIC_BIAS can be disabled if microphones are not in use in the power-down state.

² Test conditions: 30 pF load, 2.0 MHz frequency, 3.3 V A_{VDD}.

³ Powering down the MIC_BIAS powers down all port MIC_BIAS pins. This disables all microphone bias circuits set to 100% or 50%, setting them to the Hi-Z state. The 0 Ω and Hi-Z states remain unaffected by the MIC_BIAS power state.

Table 3. AD1984 Pin Descriptions (Continued)

Mnemonic	Pin No.	I/O	Description
FILTER/REFERENCE			
V _{REF_FILT}	27	O	Voltage Reference Filter.
MIC_BIAS-B	28	O	Switchable Microphone Bias. For use with Port B (Pins 21, 22).
MIC_BIAS-C	29	O	Switchable Microphone Bias. For use with Port C (Pins 23, 24). Both MIC bias pins are capable of Hi-Z, 0 V, 1.65 V, 3.7 V, and 3.9 V (with 5.0 V on Pin 33), Hi-Z, 0 V, 1.65 V, 2.86 V, and 3.0 V (with 3.3 V on Pin 33).
DV _{CORE}	1	O	CAUTION: DO NOT APPLY 3.3 V TO THIS PIN! Filter connection for internal core voltage regulator. This pin must be connected to filter caps: 10 μ F, 1.0 μ F, and 0.1 μ F connected in parallel between Pin 1 and D _{VSS} (Pin 7).
POWER AND GROUND			
DV _{IO} 3.3V	3	I	Link Digital I/O Voltage Reference. 3.3 V
DV _{SS}	7	I	Digital supply return (ground).
DV _{DD} 3.3 V	9	I	Digital supply voltage 3.3 V. This is regulated down to DV _{CORE} on Pin 1 to supply the internal digital core internal to the AD1984.
AV _{DD} 3.3 V	25, 38	I	CAUTION: DO NOT APPLY 5 V TO THESE PINS! Analog supply voltage 3.3 V ONLY. Note: AV _{DD} supplies should be well regulated and filtered as supply noise degrades audio performance.

When connected this way the AD1984 is capable of providing +3.9 V as a mic bias to all of the mic bias pins (except on Pin 31). If 5 V is not available, connect this pin to +3.3 V (AV _{DD}) via a low-pass filter. The AD1984 produces a mic bias voltage relative to the AV _{DD} supply (typically 3.0 V @ AV _{DD} = 3.3 V).
AV _{SS}	26, 42	I	Analog supply return (ground). AV _{SS} should be connected to DV _{SS} using a conductive trace under, or close to, the AD1984.

The symbols used in this table are defined as: I = Input, O = Output, LI = Line Level Input, LO = Line Level Output, HP = Output capable of driving headphone load, MIC = Input supports microphones with MIC bias and boost amplifier.
