1. GENERAL DESCRIPTION

The TC35083P/F is a high precision, and high speed monolithic CMOS 10-bit successive approximation A-D converter with a 10-bit parallel output or an 8-bit time sharing output. It has a 2 channel analog multiplexer input. Conversion data may be output in any of three forms depending on interface requirements. Also, having a built in oscillator circuit, the frequency can be set by means of an external resistor (R) and capacitor (C).

2. FEATURES

- High accuracy : 1.5LSB MAX. @Ta = -40~85°C
- High speed conversion : 11μs @ fCKI = 2.0MHz
- Single power supply : 5.0V ± 10%
- Built-in 2-channel Analog multiplexer
- Latched 3-state output
- Built-in clock oscillation circuit
- Zero or full scale adjustment free

2.1 APPLICATIONS

- Industrial Control Instruments
- Electrical Wiring Apparatus

TC35083P/F

3. SYSTEM DESCRIPTION

4. PIN DESCRIPTION

PIN.NO.	SYMBOL	NAME & FUNCTION						
1	\overline{CS}	[Chip Select] Chip select signal input. When low, permits reading and writing.						
2	\overline{RD}	[Read] Data read signal input. When low, conversion data is output.						
3	\overline{WR}	[Write] Conversion start signal input. Conversion starts on the falling edge.						
4	CKI	[Clock Input] Basic clock input for conversion operation.						
5	\overline{INTR}	[Interrupt] End of conversion signal output. When conversion is completed, it goes low and at the first input \overline{WR} or \overline{RD} , it goes high.						
6	V_{IN1}	[Analog Input] Analog input terminal. Input voltage range is from AGND to V_{REF} .						
7	V_{IN0}							
<table border="1" style="float: right; margin-left: auto; margin-right: auto;"> <thead> <tr> <th>On channel</th> <th>CHS</th> </tr> </thead> <tbody> <tr> <td>V_{IN0}</td> <td>"L"</td> </tr> <tr> <td>V_{IN1}</td> <td>"H"</td> </tr> </tbody> </table>			On channel	CHS	V_{IN0}	"L"	V_{IN1}	"H"
On channel	CHS							
V_{IN0}	"L"							
V_{IN1}	"H"							
8	AGND	[Analog Ground] AGND defines the zero level of V_{IN} .						
9	V_{REF}	[Voltage Reference] V_{REF} defines the zero level of V_{IN} .						
10	BIT1	[Data Output] Conversion Data Output Terminal.						
11	BIT0							
12	V_{SS}	[Digital Ground] System Ground Terminal. Usually 0.0V.						
13	BIT9	[Data Output / Input] Write mode ($\overline{WR} = "L"$) : I0 to I2 input mode. According to MODE, writes the data of channel select (CHS) and output control (BUSC, OUTC). READ MODE ($\overline{RD} = "L"$) : Outputs the conversion data from BIT0 to BIT9 according to output control status (BUSC, OUTC). BIT0 : LSB BIT9 : MSB						
14	BIT8							
15	BIT7							
16	BIT6							
17	BIT5							
18	BIT4 / I2							
19	BIT3 / I1							
20	BIT2 / I0							
21	MODE	[Mode] Designates the data write mode (I0 to I2). MODE = "L" : I0 input mode MODE = "H" : I0 to I2 input mode.						
22	(NC)	[No connection]						
23	CKO	[Clock output] Basic clock output terminal for conversion.						
24	V_{DD}	[Power Supply] Supply Terminal 5.0V \pm 10%.

21	MODE	[Mode] Designates the data write mode (I0 to I2). MODE = "L" : I0 input mode MODE = "H" : I0 to I2 Input mode.						
22	(NC)	[No connection]						
23	CKO	[Clock output] Basic clock output terminal for conversion.						
24	V_{DD}	[Power Supply] Supply Terminal 5.0V \pm 10%.						

5.2 SYSTEM INITIALIZATION

When \overline{CS} and \overline{WR} are set low at the same time, all circuits except the output latch circuit are reset. If the power is switched "ON" or a wrong operation occurs, reset the system and run at least one conversion cycle as a dummy.

5.3 A to D CONVERSION

\overline{CS} and \overline{WR} set low at the same time and write the channel select (CHS) and output control (BUSC, OUTC) are set according to MODE. The conversion starts at the first edge and after a certain period, \overline{INTR} goes low. When \overline{CS} and \overline{RD} are low, conversion data is output from BIT0 to 9 according to the output control. After conversion is completed and the first read signal (\overline{RD}) or the first write signal (\overline{WR}) goes low, \overline{INTR} goes high.

Sampling Time ($T_{smp.}$) = $8/f_{CKI} + \alpha$
 Comparing Time ($T_{comp.}$) = $13/f_{CKI}$
 Conversion Time (T_c) = $T_{smp.} + T_{comp.}$ $\alpha \leq 1/f_{CKI}$

TOSHIBA (LOGIC/MEMORY)

TC35083P/F

① Data Writing

BIT2/I0, BIT3/I1 and BIT4/I2 go to on input mode according to the MODE, CS and WR are low. Channel select (CHS) and output control (BUSC, OUTC) can be set. I0, I1 and I2 become the input for the CHS, BUSC and OUTC signals respectively.

● Input mode setting (MODE)

MODE = "L" : BIT2/I0 goes to an input mode and sets channel select (CHS). When MODE is "H" level, BIT2/I0, BIT3/I1, BIT4/I2 are set to the input mode and set the channel select (CHS) and output control.

● Channel Select (CHS)

When CHS is "L" level, VIN0 is selected.
When CHS is "H" level, VIN1 is selected.

● Output Control (BUSC, OUTC)

BUSC	OUTC	OUTPUT MODE
L	*1	10BIT Parallel Output
H	L	8BIT Time Sharing Output (At the 2nd Byte : Lower 6Bit = "L")
H	H	8BIT Time Sharing Output (At the 2nd Byte : Upper 6BIT = "L")

*1 : Don't care.

② Conversion Time (TC)

CS and WR go low and the sampling of the selected analog input starts at the first raising edge of two signals in about 8/fckI (Sampling Time). Next, the actual conversion period occurs, the analog input level is converted to digital (Conversion period = 13/fckI).

③ Conversion Data output

When CS and RD are low, conversion data is output from BIT0 to BIT9 according to the setting of the output control.

5.4 CLOCK

The clock input contains an internal oscillation circuit, the frequency of which is controlled by means of an external resistor and capacitor which determine the frequency. An external clock can be input directly to the CKI pin.

$$f_{CK} \approx \frac{1}{1.8RC}$$

5.5 APPLICATION CIRCUIT of 8-BIT TIME SHARING OUTPUT

① BUSC = "H"
OUTC = "L"

② BUSC = "H"
OUTC = "H"
