

## 8-Channel/Dual 4-Channel, Low-Leakage, CMOS Analog Multiplexers

**MAX338/MAX339**

### General Description

The MAX338/MAX339 are monolithic, CMOS analog multiplexers (muxes). The 8-channel MAX338 is designed to connect one of eight inputs to a common output by control of a 3-bit binary address. The dual, 4-channel MAX339 is designed to connect one of four inputs to a common output by control of a 2-bit binary address. Both devices can be used as either a mux or a demux. On-resistance is  $400\Omega$  max, and the devices conduct current equally well in both directions.

These muxes feature extremely low off leakages (less than  $20\text{pA}$  at  $+25^\circ\text{C}$ ), and extremely low on-channel leakages (less than  $50\text{pA}$  at  $+25^\circ\text{C}$ ). The new design offers guaranteed low charge injection ( $1.5\text{pC}$  typ) and electrostatic discharge (ESD) protection greater than  $2000\text{V}$ , per method 3015.7. These improved muxes are pin-compatible upgrades for the industry-standard DG508A and DG509A. For similar Maxim devices with lower leakage and charge injection but higher on-resistance, see the MAX328 and MAX329.

The MAX338/MAX339 operate from a single  $+4.5\text{V}$  to  $+30\text{V}$  supply or from dual supplies of  $\pm 4.5\text{V}$  to  $\pm 20\text{V}$ . All control inputs (whether address or enable) are TTL compatible ( $+0.8\text{V}$  to  $+2.4\text{V}$ ) over the full specified temperature range and over the  $\pm 4.5\text{V}$  to  $\pm 18\text{V}$  supply range. These parts are fabricated with Maxim's 44V silicon-gate process.

### Applications

Data-Acquisition Systems	Sample-and-Hold Circuits
Test Equipment	Heads-Up Displays
Military Radios	Communications Systems
Guidance and Control Systems	PBX, PABX

### Features

- ◆ On-Resistance,  $<400\Omega$  max
- ◆ Transition Time,  $<500\text{ns}$
- ◆ On-Resistance Match,  $<10\Omega$
- ◆ NO-Off Leakage Current,  $<20\text{pA}$  at  $+25^\circ\text{C}$
- ◆ 1.5pC Charge Injection
- ◆ Single-Supply Operation ( $+4.5\text{V}$  to  $+30\text{V}$ ) Bipolar-Supply Operation ( $\pm 4.5\text{V}$  to  $\pm 20\text{V}$ )
- ◆ Plug-In Upgrade for Industry-Standard DG508A/DG509A
- ◆ Rail-to-Rail Signal Handling
- ◆ TTL/CMOS-Logic Compatible
- ◆ ESD Protection  $>2000\text{V}$ , per Method 3015.7

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX338CPE	$0^\circ\text{C}$ to $+70^\circ\text{C}$	16 Plastic DIP

## ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-

V+	-0.3V, 44V
GND	-0.3V, 25V
Digital Inputs, NO, COM (Note 1)	(V+ - 2V) to (V+ + 2V) or 30mA (whichever occurs first)
Continuous Current (any terminal)	30mA
Peak Current, NO or COM (pulsed at 1ms, 10% duty cycle max)	100mA

Continuous Power Dissipation (TA = +70°C)

Plastic DIP (derate 10.53mW/°C above +70°C)	842mW
Narrow SO (derate 8.70mW/°C above +70°C)	696mW
16-Pin TQFN (derate 21.3mW/°C above +70°C)	1702mW
CERDIP (derate 10.00mW/°C above +70°C)	800mW

Operating Temperature Ranges

MAX33_C	0°C to +70°C
MAX33_E	-40°C to +85°C
MAX33_MJE	-55°C to +125°C

Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

**Note 1:** Signals on NO, COM, EN, A0, A1, or A2 exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—Dual Supplies

**Note 2:** The algebraic convention where the most negative value is a minimum and the most positive value a maximum is used in this data sheet.

**Note 3:** Guaranteed by design.

**Note 4:**  $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$ .

**Note 5:** Leakage parameters are 100% tested at the maximum rated hot temperature and guaranteed by correlation at +25°C.

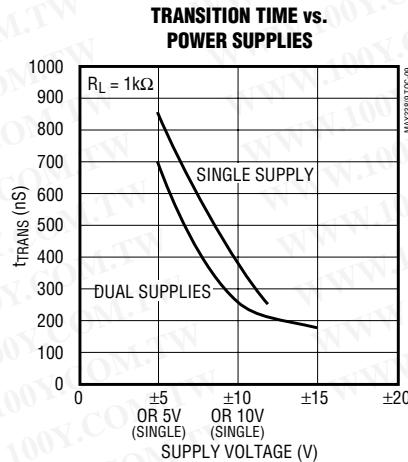

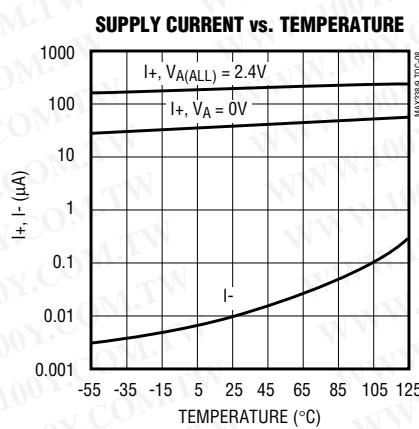

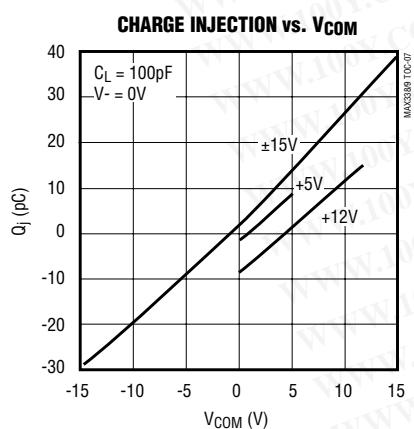

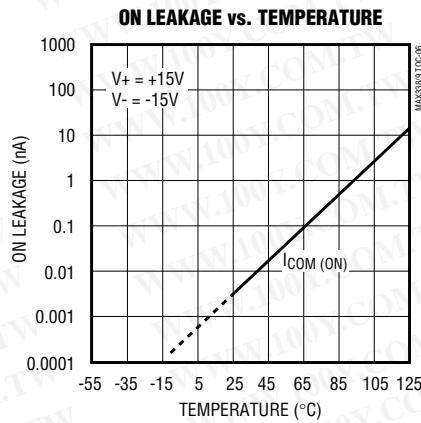

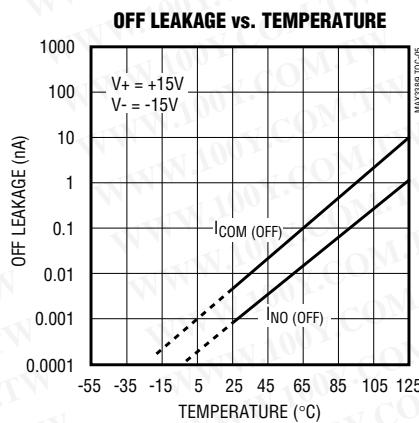

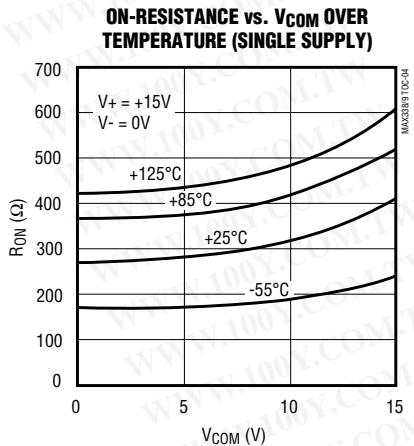

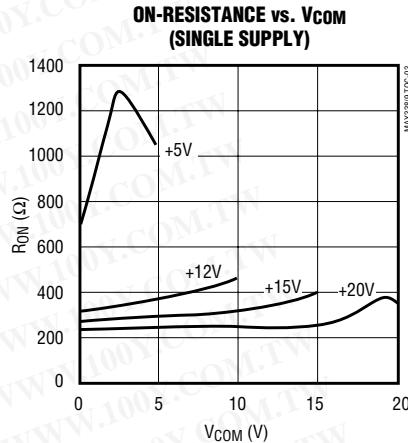

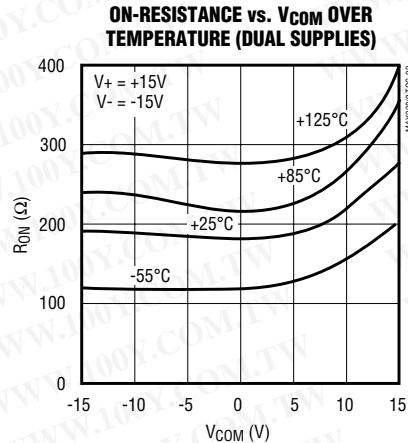

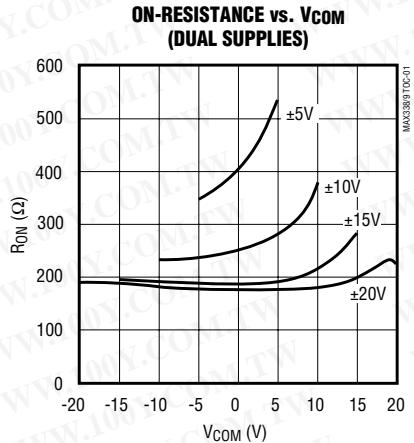

**Note 6:** Worst-case isolation is on channel 4 because of its proximity to the drain pin. Off isolation =  $20\log \frac{V_{COM}}{V_{NO}}$ , where V<sub>COM</sub> = output and V<sub>NO</sub> = input to off switch.

## Applications Information

### Operation with Supply Voltages Other than 15V

Using supply voltages less than  $\pm 15V$  will reduce the analog signal range. The MAX338/MAX339 switches operate with  $\pm 4.5V$  to  $\pm 20V$  bipolar supplies or with a  $+4.5V$  to  $+30V$  single supply. Connect V- to GND when operating with a single supply. Both device types can also operate with unbalanced supplies such as  $+24V$  and  $-5V$ . The *Typical Operating Characteristics* graphs show typical on-resistance with  $20V$ ,  $15V$ ,  $10V$ , and  $5V$  supplies. (Switching times increase by a factor of two or more for operation at  $5V$ .)

### Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence V+ on first, then V-, followed by the logic inputs NO and COM. If power-supply sequencing is not possible, add two small signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to 1V below V+ and 1V above V-, but does not affect the devices' low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed 44V.
