**Product specification** File under Integrated Circuits, IC06 September 1993

Philips Semiconductors Product specification

# Octal bus transceiver; 3-state

74HC/HCT245

## **FEATURES**

- Octal bidirectional bus interface
- · Non-inverting 3-state outputs
- WW.100Y.COM.TW · Output capability: bus driver
- I<sub>CC</sub> category: MSI

#### **GENERAL DESCRIPTIONS**

The 74HC/HCT245 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT245 are octal transceivers featuring non-inverting 3-state bus compatible outputs in both send and receive directions. The "245" features an output enable (OE) input for easy cascading and a send/receive (DIR) for direction control. OE controls the outputs so that the buses are effectively isolated. The "245" is similar to the "640" but has true (non-inverting) outputs.

# **QUICK REFERENCE DATA**

C <sub>I</sub> /O	input/output capacitance	W.TM	10	10	pF
C <sub>PD</sub>	power dissipation capacitance per transceiver	notes 1 and 2	30	30	pF

#### Notes

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu W$ ):

 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$  where:

f<sub>i</sub> = input frequency in MHz

 $f_o$  = output frequency in MHz

 $\sum (C_L \times V_{CC}^2 \times f_0) = \text{sum of outputs}$ 

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$ 

For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5 \text{ V}$
