

## 4-Pin Micropower Voltage Monitors

### General Description

The MAX836/MAX837 micropower voltage monitors contain a 1.204V precision bandgap reference and a comparator in a SOT143 package. The MAX836 has an open-drain, n-channel output driver, while the MAX837 has a push-pull output driver. Two external resistors set the trip threshold voltage.

### Features

- ◆  $\pm 1.25\%$  Precision Voltage Threshold
- ◆ SOT143 Package
- ◆ Low Cost
- ◆  $< 5\mu A$  Typical Supply Current
- ◆ Open-Drain Output (MAX836)  
Push-Pull Output (MAX837)

### Applications

Precision Battery Monitor  
 Load Switching  
 Battery-Powered Systems  
 Threshold Detectors

### Ordering Information

| PART*       | TEMP RANGE     | PIN-PACKAGE | TOP MARK |
|-------------|----------------|-------------|----------|
| MAX836EUS-T | -40°C to +85°C | 4 SOT143-4  | EQAA     |
| MAX837EUS-T | -40°C to +85°C | 4 SOT143-4  | EQAA     |

\*All devices available in tape-and-reel only. Contact factory for availability.

Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing "-T" with "+T" when ordering.

| Lead Temperature (soldering, 10s)  | +300°C          |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +2.5V to +11.0V, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.)

| Output-Voltage Low                  | V <sub>OL</sub>   | V <sub>IN</sub> < V <sub>THMIN</sub> , I <sub>SINK</sub> = 500μA                 |  |   |       |       | 0.4                 | V     |  |  |

**Note 1:** The voltage-detector output remains in the direct state for V<sub>CC</sub> down to 1.2V when V<sub>IN</sub> ≤ V<sub>CC</sub> / 2.

**Note 2:** Supply current has a monotonic dependence on V<sub>CC</sub> (see the *Typical Operating Characteristics*).

**Note 3:** IN leakage current has a monotonic dependence on V<sub>CC</sub> (see the *Typical Operating Characteristics*).

**Note 4:** The MAX836 open-drain output can be pulled up to a voltage greater than V<sub>CC</sub>, but may not exceed 11V.

Figure 1. Programming the Trip Voltage,  $V_{TRIP}$

### Detailed Description

The MAX836/MAX837 micropower voltage monitors contain a 1.204V precision bandgap reference and a comparator (see the *Typical Operating Circuit*). The only difference between the two parts is the structure of the comparator output driver. The MAX836 has an open-drain n-channel output driver that can be pulled up to a voltage higher than  $V_{CC}$ , but under 11V. The MAX837's output is push-pull, and can both source and sink current.

### Programming the Trip Voltage

Two external resistors set the trip voltage,  $V_{TRIP}$  (Figure 1).  $V_{TRIP}$  is the point at which the applied voltage (typically  $V_{CC}$ ) toggles OUT. The MAX836/MAX837's high input impedance allows large-value resistors without compromising trip-voltage accuracy. To minimize current consumption, select a value for  $R_2$  between  $500k\Omega$  and  $1M\Omega$ , then calculate  $R_1$  as follows:

$$R_1 = R_2 \left( \frac{V_{TRIP}}{V_{TH}} - 1 \right)$$

where  $V_{TRIP}$  = desired trip voltage (in volts),  $V_{TH}$  = threshold trip voltage (1.204V).

### Applications Information

#### Adding Hysteresis

Hysteresis adds noise immunity to the MAX836/MAX837 and prevents repeated triggering when  $V_{IN}$  is near the threshold trip voltage. Figure 2 shows how to add hysteresis to the comparator. The technique is similar for

## 4-Pin Micropower Voltage Monitors

**MAX836/MAX837**

both parts. For the MAX836, select the ratio of resistors R1 and R2 so that IN sees 1.204V when the monitor voltage falls to or rises above the desired trip point ( $V_{TRIP}$ ). R3 adds hysteresis and is typically an order of magnitude larger than R1 or R2. The current through R1 and R2 should be at least 500nA to ensure that the 12nA maximum input current does not shift the trip point significantly. Capacitor C1 adds additional noise rejection.

### Monitoring Voltages Other than V<sub>CC</sub>

The MAX836/MAX837 can monitor voltages other than V<sub>CC</sub> (Figure 3). Calculate  $V_{TRIP}$  as shown in the *Programming the Trip Voltage* section. The monitored voltage (V<sub>MON</sub>) is independent of V<sub>CC</sub>. V<sub>IN</sub> must be 1V less than V<sub>CC</sub>.

### Heater Temperature Control

Figure 4 shows a basic heater temperature-control circuit. Upon power-up, OUT is high and the n-channel MOSFET turns on. Current flows through the heating element (R4), warming the surrounding area. R2 is a negative-temperature-coefficient thermistor and as temperature increases, its resistance decreases. As the thermistor heats up and its resistance decreases, the MAX837's voltage at IN decreases until it reaches the 1.204V threshold voltage. At this point, OUT goes low, turning off the heating element. The thermistor cools and the voltage at IN rises until it overcomes the MAX837's hysteresis (6mV). OUT returns high when this point is reached, turning on the heating element again. This cycle repeats as long as power is applied.

Determine the thermistor's resistance (R2) at the desired temperature. Then, using R2's resistance and half the resistance of R3, calculate R1's value with the following formula:

$$R1 = (R2 + R3) \left( \frac{V_{CC}}{1.204} - 1 \right)$$
