The 80C196KC 16－bit microcontroller is a high performance member of the MCS ${ }^{\circledR} 96$ microcontroller family． The 80C196KC is an enhanced 80C196KB device with 488 bytes RAM， 16 and 20 MHz operation and an optional 16 Kbytes of ROM／OTPROM．Intel＇s CHMOS III process provides a high performance processor along with low power consumption．

The 87C196KC is an 80C196KC with 16 Kbytes on－chip OTPROM．The 83C196KC is an 80C196KC with 16 Kbytes factory programmed ROM．In this document，the 80C196KC will refer to all products unless otherwise stated．

Four high－speed capture inputs are provided to record times when events occur．Six high－speed outputs are available for pulse or waveform generation．The high－speed output can also generate four software timers or start an A／D conversion．Events can be based on the timer or up／down counter．

With the commercial（standard）temperature option，operational characteristics are guaranteed over the tem－ perature range of $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ ．With the extended（Express）temperature range option，operational charac－ teristics are guaranteed over the temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ ．Unless otherwise noted，the specifi－ cations are the same for both options．

See the Packaging information for extended temperature designators．

## PROCESS INFORMATION

This device is manufactured on PX29．5 or PX29．9，a CHMOS III process．Additional process and reliabili－ ty information is available in Intel＇s Components Quality and Reliability Handbook，Order Number 210997.

EXAMPLE：N87C196KC is 68－Lead PLCC OTPROM， 16 MHz ．
For complete package dimensional data，refer to the Intel Packaging Handbook（Order Number 240800）．

## NOTE：

1．EPROMs are available as One Time Programmable （OTPROM）only．

## PIN DESCRIPTIONS

| Symbol | Name and Function |
| :---: | :---: |
| $\mathrm{V}_{\text {CC }}$ | Main supply voltage（5V）． |
| $V_{S S}$ | Digital circuit ground（ O V ）．There are multiple $\mathrm{V}_{\text {SS }}$ pins，all of which must be connected． |
| $V_{\text {REF }}$ | Reference voltage for the A／D converter（ 5 V ）． $\mathrm{V}_{\text {REF }}$ is also the supply voltage to the analog portion of the A／D converter and the logic used to read Port 0 ．Must be connected for A／D and Port 0 to function． |
| ANGND | Reference ground for the A／D converter．Must be held at nominally the same potential as $V_{S S}$ ． |
| $V_{P P}$ | Timing pin for the return from powerdown circuit．This pin also supplies the programming voltage on the EPROM device． |
| XTAL1 | Input of the oscillator inverter and of the internal clock generator． |
| XTAL2 | Output of the oscillator inverter． |
| CLKOUT | Output of the internal clock generator．The frequency of CLKOUT is $1 / 2$ the oscillator frequency． |
| $\overline{\text { RESET }}$ | Reset input and open drain output． |
| BUSWIDTH | Input for buswidth selection．If CCR bit 1 is a one，this pin selects the bus width for the bus cycle in progress．If BUSWIDTH is a 1 ，a 16 －bit bus cycle occurs．If BUSWIDTH is a 0 an 8 －bit cycle occurs．If CCR bit 1 is a 0 ，the bus is always an 8 －bit bus． |
| NMI | A positive transition causes a vector through 203EH． |
| INST | Output high during an external memory read indicates the read is an instruction fetch．INST is valid throughout the bus cycle．INST is activated only during external memory accesses and output low for a data fetch． |
| EA | Input for memory select（External Access）．EA equal high causes memory accesses to locations 2000 H through 5FFFH to be directed to on－chip ROM／EPROM．EA equal to low causes accesses to those locations to be directed to off－chip memory．Also used to enter programming mode． |
| ALE／$\overline{\text { ADV }}$ | Address Latch Enable or Address Valid output，as selected by CCR．Both pin options provide a signal to demultiplex the address from the address／data bus．When the pin is $\overline{\mathrm{ADV}}$ ，it goes inactive high at the end of the bus cycle．ALE／$\overline{\text { ADV }}$ is activated only during external memory accesses． |
| $\overline{\mathrm{RD}}$ | Read signal output to external memory．$\overline{\mathrm{RD}}$ is activated only during external memory reads． |
|  | Write and Write Low output to external memory，as selected by the CCR．$\overline{\mathrm{WR}}$ will go low for every external write，while WRL will go low only for external writes where an even byte is being written．$\overline{\mathrm{WR}} / \overline{\mathrm{WRL}}$ is activated only during external memory writes． |
| $\overline{\text { BHE } / \overline{W R H}}$ | Bus High Enable or Write High output to external memory，as selected by the CCR．BHE will go low for external writes to the high byte of the data bus．WRH will go low for external writes where an odd byte is being written．$\overline{\mathrm{BHE}} / \overline{\mathrm{WRH}}$ is activated only during external memory writes． |
| READY | Ready input to lengthen external memory cycles，for interfacing to slow or dynamic memory， or for bus sharing．When the external memory is not being used，READY has no effect． |
| HSI | Inputs to High Speed Input Unit．Four HSI pins are available：HSI．0，HSI．1，HSI． 2 and HSI．3． Two of them（HSI． 2 and HSI．3）are shared with the HSO Unit． |
| HSO | Outputs from High Speed Output Unit．Six HSO pins are available：HSO．0，HSO．1，HSO．2， HSI．3，HSO． 4 and HSO．5．Two of them（HSO． 4 and HSO．5）are shared with the HSI Unit． |
| Port 0 | 8 －bit high impedance input－only port．These pins can be used as digital inputs and／or as analog inputs to the on－chip A／D converter． |
| Port 1 | 8 －bit quasi－bidirectional I／O port． |
| Port 2 | 8－bit multi－functional port．All of its pins are shared with other functions in the 80C196KC． Pins 2.6 and 2.7 are quasi－bidirectional． |

## PIN DESCRIPTIONS（Continued）

| Symbol | $\quad$ Name and Function |
| :--- | :--- |
| Ports 3 and 4 | 8－bit bidirectional I／O ports with open drain outputs．These pins are shared with the <br> multiplexed address／data bus which has strong internal pullups． |
| $\overline{\text { HOLD }}$ | Bus Hold input requesting control of the bus． |
| $\overline{\text { HLDA }}$ | Bus Hold acknowledge output indicating release of the bus． |
| $\overline{\text { BREQ }}$ | Bus Request output activated when the bus controller has a pending external memory <br> cycle． |
| PMODE | Determines the EPROM programming mode． |
| $\overline{\text { PACT }}$ | A low signal in Auto Programming mode indicates that programming is in process．A high <br> signal indicates programming is complete． |
| CPVER | Cummulative Program Output Verification．Pin is high if all locations have programmed <br> correctly since entering a programming mode． |
| $\overline{\text { PALE }}$ | A falling edge in Slave Programming Mode and Auto Configuration Byte Programming Mode <br> indicates that ports 3 and 4 contain valid programming address／command information <br> （input to slave）． |
| $\overline{\text { PROG }}$ | A falling edge in Slave Programming Mode indicates that ports 3 and 4 contain valid <br> programming data（input to slave）． |
| PVER | A high signal in Slave Programmig Mode and Auto Configuration Byte Programming Mode <br> indicates the byte programmed correctly． |
| $\overline{\text { AINC }}$ | Auto Increment．Active low input signal indicates that the auto increment mode is enabled． <br> Auto Increment will allow reading or writing of sequential EPROM locations without address <br> transactions across the PBUS for each read or write． |

NOTES：
1．All pins except RESET and XTAL1．
2．Violating these specifications in Reset may cause the part to enter test modes．
3．Commercial specifications apply to express parts except where noted．
4．QBD（Quasi－bidirectional）pins include Port 1，P2．6 and P2．7
5．Standard Outputs include ADO－15，$\overline{R D}, \overline{W R}$, ALE， $\bar{B} H E$, INST，HSO pins，PWM／P2．5，CLKOUT，RESET，Ports 3 and 4， TXD／P2．0 and RXD（in serial mode 0）．The $\mathrm{V}_{\mathrm{OH}}$ specification is not valid for RESET．Ports 3 and 4 are open－drain outputs． 6．Standard Inputs include HSI pins，READY，BUSWIDTH，RXD／P2．1，EXTINT／P2．2，T2CLK／P2．3 and T2RST／P2．4．
7．Maximum current per pin must be externally limited to the following values if $\mathrm{V}_{\mathrm{OL}}$ is held above 0.45 V or $\mathrm{V}_{\mathrm{OH}}$ is held below $\mathrm{V}_{\mathrm{CC}}-0.7 \mathrm{~V}$ ：
lol on Output pins： 10 mA
${ }^{\mathrm{OH}}$ on quasi－bidirectional pins：self limiting
$\mathrm{I}_{\mathrm{OH}}$ on Standard Output pins： 10 mA
8．Maximum current per bus pin（data and control）during normal operation is $\pm 3.2 \mathrm{~mA}$ ．
9．During normal（non－transient）conditions the following total current limits apply：
Port 1，P2． 6
IOL： 29 mA
$\mathrm{IOH}^{\mathrm{OH}}$ is self limiting
HSO，P2．0，RXD，$\overline{\text { RESET }}$
P2．5，P2．7，$\overline{\mathrm{WR}}, \overline{\mathrm{BHE}}$

## NOTES：

1．Testing performed at 8 MHz ．However，the device is static by design and will typically operate below 1 Hz ．
2．Assuming back－to－back bus cycles．
3．8－Bit bus only．
4．If wait states are used，add 2 TOSC ${ }^{*} N$ ，where $N=$ number of wait states．

## EXPLANATION OF AC SYMBOLS

Each symbol is two pairs of letters prefixed by＂ T ＂for time．The characters in a pair indicate a signal and its condition，respectively．Symbols represent the time between the two signal／condition points．

Conditions：
H－High
L－Low
V— Valid
X— No Longer Valid
Z－Floating
Signals：
A－Address
B－$\overline{\text { BHE }}$
C－CLKOUT
D－DATA
G－Buswidth
H－$\overline{\text { HOLD }}$
HA $\overline{\text { HLDA }}$
signals：
B－$\overline{B H E}$
C－CLKOUT
D－DATA
G－Buswidth

HA－HLDA

L－ALE／$\overline{\text { ADV }}$
BR－$\overline{B R E Q}$
R －$\overline{\mathrm{RD}}$
W－$\overline{\mathrm{WR}} / \overline{\mathrm{WRH}} / \overline{\mathrm{WRL}}$
X— XTAL1
Y－READY
Q－Data Out

NOTES：
＊An＂LSB＂as used here has a value of approxiimately 5 mV ．（See Embedded Microcontrollers and Processors Handbook for A／D glossary of terms）．
1．These values are expected for most parts at $25^{\circ} \mathrm{C}$ but are not tested or guaranteed．
2．DC to 100 KHz ．
3．Multiplexer Break－Before－Make is guaranteed．
4．Resistance from device pin，through internal MUX，to sample capacitor．
5．These values may be exceeded if the pin current is limited to $\pm 2 \mathrm{~mA}$ ．
6．Applying voltages beyond these specifications will degrade the accuracy of all channels being converted．
7．All conversions performed with processor in IDLE mode．

SLAVE PROGRAMMING MODE TIMING IN DATA PROGRAM WITH REPEATED PROG PULSE AND AUTO INCREMENT

## 8XC196KB TO 8XC196KC DESIGN CONSIDERATIONS

1．Memory Map．The 8 XC196KC has 512 bytes of RAM／SFRs and an optional 16 K of ROM／OTPROM．The extra 256 bytes of RAM will reside in locations $100 \mathrm{H}-1 \mathrm{FFH}$ and the extra 8 K of ROM／OTPROM will reside in locations $4000 \mathrm{H}-5 \mathrm{FFFH}$ ．These locations are external memory on the 8XC196KB．
2．The CDE pin on the $K B$ has become a $V_{S S}$ pin on the KC to support $16 / 20 \mathrm{MHz}$ operation．
3．EPROM programming．The 8 XC196KC has a dif－ ferent programming algorithm to support 16 K of on－board memory．When performing Run－Time Programming，use the section of code in the 8XC196KC User＇s Guide．

4．ONCE Mode Entry．The ONCE mode is entered on the 8XC196KC by driving the TXD pin low on the rising edge of RESET．The TXD pin is held high by a pullup that is specified by $\mathrm{I}_{\mathrm{OH} 1}$ ．This Pullup must not be overridden or the 8XC196KC will enter the ONCE mode．
5．During the bus HOLD state，the 8XC196KC weakly holds $\overline{R D}, \overline{W R}$, ALE，$\overline{B H E}$ and INST in their inactive states．The 8XC196KB only holds ALE in its inactive state．

6．A RESET pulse from the $8 \times C 196 \mathrm{KC}$ is 16 states rather than 4 states as on the 8XC196KB（i．e．，a watchdog timer overflow）．This provides a longer RESET pulse for other devices in the system．

## 8XC196KC ERRATA

1．Missed EXTINT on P0．7．
The 80C196KC20 could possibly miss an EXTINT on P0．7．See techbit MC0893．
2． HSI ＿＿MODE divide－by－eight．
See Faxback \＃2192．
3．IPD hump．
See Faxback \＃ 2311.

## DATA SHEET REVISION HISTORY

This data sheet is valid for devices with a＂H＂，＂L＂or＂$M$＂at the end of the topside tracking number．The topside tracking number consists of nine characters and is the second line on the top side of the device．Data sheets are changed as new device information becomes available．Verify with your local Intel sales office that you have the latest version before finalizing a design or ordering devices．

The following are differences between the 270942－004 and 270942－005 datasheets：
1．Removed＂Word Addressable Only＂from Port 3 and 4 in Table 2.
2．Renamed PVAL to CPVER．
3．Removed TLLYV and $T_{\text {LLGV }}$ from the waveform diagrams．
4．Added HSI＿＿MODE divide－by－eight and IPD hump to $8 \times C 196 \mathrm{KC}$ errata．
The following are important differences between the 270942－002 and 270942－004 data sheets：
1．NMI during PTS，QBD port glitch and Divide HOLD／READY erratas were fixed and have been removed from the data sheet．The HSI errata is also removed as this is now considered normal operation．
2．Combined 16 and 20 MHz data sheets．Data sheet $270924-001(20 \mathrm{MHz})$ is now obsolete．
3．Added 80 －lead SQFP package pinout．
4．Added documentation for CLKOUT disable bit．
5．$\theta_{J A}$ for QFP package was changed to $55^{\circ} \mathrm{C} / \mathrm{W}$ from $42^{\circ} \mathrm{C} / \mathrm{W}$ ．
6．$\theta_{\mathrm{JC}}$ for QFP package was changed to $16^{\circ} \mathrm{C} / \mathrm{W}$ from $\mathrm{TBD}^{\circ} \mathrm{C} / \mathrm{W}$ ．
7． $\mathrm{T}_{\text {SAM }}(\mathrm{MIN})$ in 10 －bit mode was changed to $1.0 \mu \mathrm{~s}$ from $3.0 \mu \mathrm{~s}$ ．
8． $\mathrm{T}_{\text {SAM }}(\mathrm{MIN})$ in 8 －bit mode was changed to $1.0 \mu \mathrm{~s}$ from $2.0 \mu \mathrm{~s}$ ．
9．I IL1 specification for port 2.0 was renamed IIL2．
10．$I_{\text {IL2 }}(M A X)$ is changed to $T B D$ from -6 mA ．
11． $\mathrm{I}_{\mathrm{IH} 1}(M A X)$ is changed to $+200 \mu \mathrm{~A}$ from $+100 \mu \mathrm{~A}$ ．
12． $\mathrm{I}_{\mathrm{IH} 1}$ test condition changes to $\mathrm{V}_{\mathrm{IN}}=2.4 \mathrm{~V}$ from $\mathrm{V}_{\mathrm{IN}}=5.5 \mathrm{~V}$ ．
13． $\mathrm{V}_{\text {HYS }}$ is changed to 300 mV from 150 mV ．
14． $\mathrm{I}_{\mathrm{CC}}$（TYP）at 16 MHz is changed to 65 mA from 50 mA ．
15．I $\mathrm{ICC}(\mathrm{MAX}$ ）at 16 MHz is changed to 75 mA from 70 mA ．
16． $\mathrm{I}_{\mathrm{CC}}$（TYP）at 20 MHz is changed to 80 mA from 60 mA ．
17． $\mathrm{I}_{\mathrm{CC}}(\mathrm{MAX})$ at 20 MHz is changed to 92 mA from 86 mA ．
18．$l_{\text {IDLE }}(T Y P)$ at 16 MHz is changed to 17 mA from 15 mA ．
19．IIDLE（MAX）at 16 MHz is changed to 25 mA from 30 mA ．
20．lidLE（TYP）at 20 MHz is changed to 21 mA from 15 mA ．
21．IIDLE（MAX）at 20 MHz is changed to 30 mA from 35 mA ．
22．IPD（TYP）at 16 MHz is changed to $8 \mu \mathrm{~A}$ from $15 \mu \mathrm{~A}$ ．
23．$I_{P D}(M A X)$ at 16 MHz is changed to $15 \mu \mathrm{~A}$ from TBD．
24．IPD（TYP）at 20 MHz is changed to $8 \mu \mathrm{~A}$ from $18 \mu \mathrm{~A}$ ．
25．IPD（MAX）at 20 MHz is changed to $15 \mu \mathrm{~A}$ from TBD．
26．$T_{C L D V}(M A X)$ is changed to $T_{O S C}-45 n s$ from $T_{O S C}-50 n s$ ．
27．$T_{\text {LLAX }}(\mathrm{MIN})$ is changed to TOSC -35 ns from $T_{\text {OSC }}-40 \mathrm{~ns}$ ．
28． $\mathrm{T}_{\mathrm{CHWH}}(\mathrm{MIN})$ is changed to -5 ns from -10 ns ．
29．$T_{\text {RHAX }}(\mathrm{MIN})$ is changed to $T_{\text {OSC }}-25 \mathrm{~ns}$ from $T_{\text {OSC }}-30 \mathrm{~ns}$ ．
30．THALAZ（MAX）is changed to +15 ns from +10 ns ．
31．$T_{\text {HALBZ }}(M A X)$ is changed to +20 ns from +15 ns ．

32．$T_{\text {HAHBV }}$（MAX）is now specified at +15 ns ，was formerly unspecified．
33．The $T_{\text {LLYV }}$ and $T_{\text {LLGV }}$ specifications were removed．These specifications are not required in high－speed systems designs．
34．Added EXTINT，PO．7 errata to Errata section．
The following are the important differences between the－001 and－002 versions of data sheet 270942 ．
1．Express and Commercial devices are combined into one data sheet．The Express only data sheet 270794－001 is obsolete．

2．Removed KB／KC feature set differences，pin definition table，and SFR locations and bitmaps．
3．Added programming pin function to package drawings and pin descriptions．
4．Changed absolute maximum temperature under bias from $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ to $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ ．
5．Replaced $\mathrm{V}_{\mathrm{OH} 2}$ specification with $\mathrm{IOH}_{1}$ and $\mathrm{I}_{\mathrm{IL} 1}$ specifications．
6．Added $\mathrm{I}_{\mathrm{H} 1}$ specification for NMI pulldown resistors．
7．Added maximum hold latency table．
8．Added external oscillator and external clock circuit drawings．
9．Changed Clock Drive $T_{X H X X}$ and $T_{X L X X}$ Min spec to 20 ns ．
10．Fixed Serial Port $T_{X L X H}$ specification．
11．Added 8 －and 10 －bit mode A／D operating conditions tables．
12．Specified operating range for sample and convert times．
13．Added specification for voltage on analog input pin．
14．Put operating conditions for EPROM programming into tabular format．
