APRIL 1985 - REVISED MARCH 1988

- 3-State Outputs Drive Bus Lines or Buffer Memory Address Registers
- PNP Inputs Reduce D-C Loading
- Hysteresis at Inputs Improves Noise Margins

description

These octal buffers and line drivers are designed specifically to improve both the performance and density of three-state memory address drivers, clock drivers, and bus-oriented receivers and transmitters. The designer has a choice of selected combinations of inverting and noninverting outputs, symmetrical \overline{G} (active-low output control) inputs, and complementary G and G inputs. These devices feature high fan-out, improved fan-in, and 400-mV noise-margin. The SN74LS' and SN74S' can be used to drive terminated lines down to 133 ohms.

The SN54' family is characterized for operation over the full military temperature range of $-55\,^{\circ}\text{C}$ to 125 $\,^{\circ}\text{C}$. The SN74' family is characterized for operation from $0\,^{\circ}\text{C}$ to $70\,^{\circ}\text{C}$.
