

- Adjustable Sense Voltage With Two External Resistors
- Adjustable Hysteresis of Sense Voltage
- Wide Operating Supply-Voltage Range . . . 1.8 V to 40 V
- Wide Operating-Temperature Range . . .  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Low Power Consumption ( $I_{\text{CC}} = 0.6 \text{ mA}$  TYP,  $V_{\text{CC}} = 40 \text{ V}$ )
- Minimum External Components
- Package Options Include Plastic Small-Outline (PS) and Thin Shrink Small-Outline (PW) Packages and Standard DIP (P)

P, PS, OR PW PACKAGE

NC – No internal connection

## description

The TL7700 is a bipolar integrated circuit designed for use as a reset controller in microcomputer and microprocessor systems. The SENSE voltage can be set to any value greater than 0.5 V using two external resistors. The hysteresis value of the sense voltage also can be set by the same resistors. The device includes a precision voltage reference, fast comparator, timing generator, and output driver, so it can generate a power-on reset signal in a digital system.

The TL7700 has an internal 1.5-V temperature-compensated voltage reference from which all function blocks are supplied. Circuit function is very stable, with supply voltage in the 1.8-V to 40-V range. Minimum supply current allows use with ac line operation, portable battery operation, and automotive applications.

The TL7700C is characterized for operation from  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .

AVAILABLE OPTIONS

T <sub>A</sub>	PACKAGED DEVICES		
	PLASTIC DIP (P)	PLASTIC SMALL OUTLINE (PS)	PLASTIC THIN SHRINK SMALL OUTLINE (PW)
$-40^{\circ}\text{C}$ to $85^{\circ}\text{C}$	TL7700CP	TL7700CPS	TL7700CPW

PS and PW packages are available taped and reeled. Add the suffix R to device type (e.g., TL7700CPSR).

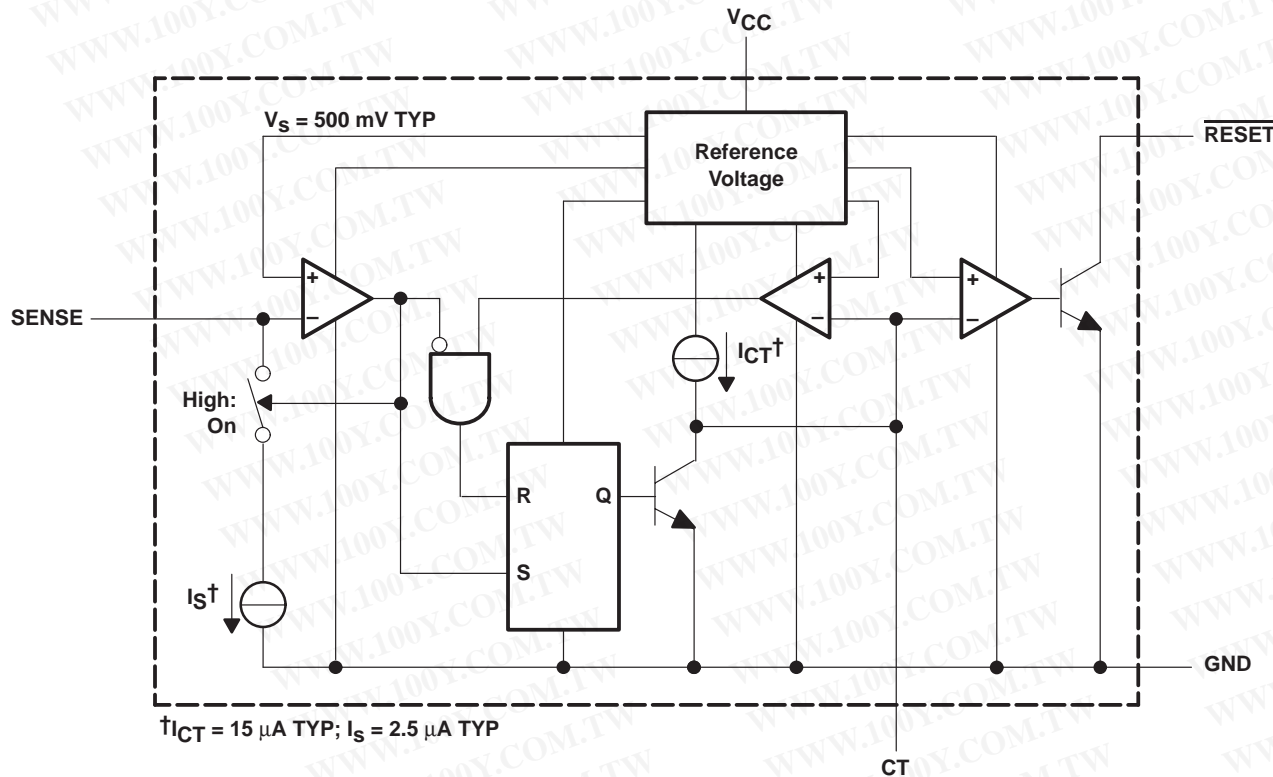

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	DESCRIPTION
CT	1	Timing capacitor connection. This terminal sets the $\overline{\text{RESET}}$ output pulse duration ( $t_{PO}$ ). It is connected internally to a 15- $\mu\text{A}$ constant-current source. There is a limit on the switching speed of internal elements; even if CT is set to 0, response speeds remain at approximately 5 to 10 $\mu\text{s}$ . If CT is open, the device can be used as an adjustable-threshold noninverting comparator. If CT is low, the internal output-stage comparator is active and the $\overline{\text{RESET}}$ output transistor is on. An external voltage must not be applied to this terminal due to the internal structure of the device. Therefore, drive the device using an open-collector transistor, FET, or 3-state buffer (in the low-level or high-impedance state).
GND	4	Ground. Keep this terminal as low impedance to reduce circuit noise.
NC	3, 6, 7	No internal connection
$\overline{\text{RESET}}$	8	Reset output. This terminal can be connected directly to a system that resets in the active-low state. A pullup resistor usually is required because the output is an npn open-collector transistor. An additional transistor should be connected when the active-high reset or higher output current is required.
SENSE	2	Voltage sense. This terminal has a threshold level of 500 mV. The sense voltage and hysteresis can be set at the same time when the two voltage-dividing resistors are connected. The reference voltage is temperature compensated to inhibit temperature drift in the threshold voltage within the operating temperature range.
VCC	5	Power supply. This terminal is used in an operating-voltage range of 1.8 V to 40 V.

**absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†**

Supply voltage, $V_{CC}$ (see Note 1)	41 V
Sense input voltage range, $V_S$	–0.3 V to 41 V
Output voltage, $V_{OH}$ (off state)	41 V
Output current, $I_{OL}$ (on state)	5 mA
Package thermal impedance, $\theta_{JA}$ (see Notes 2 and 3): P package	85°C/W
PS package	95°C/W
PW package	149°C/W
Storage temperature range, $T_{stg}$	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. All voltage values are with respect to the network ground terminal.  
 2. Maximum power dissipation is a function of  $T_J(\max)$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_J(\max) - T_A)/\theta_{JA}$ . Operating at the absolute maximum  $T_J$  of 150°C can impact reliability.  
 3. The package thermal impedance is calculated in accordance with JEDEC 51.

**recommended operating conditions**

### detailed description

#### sense-voltage setting

The sense voltage,  $V_S$ , of the TL7700 typically is 500 mV. By using two external resistors, the circuit designer can obtain any sense voltage over 500 mV. In Figure 19, the sensing voltage,  $V_S$ , is calculated as:

$$V_S = V_{CC} \times (R1 + R2)/R2$$

Where:

$$V_S = 500 \text{ mV, typically at } T_A = 25^\circ\text{C}$$

At room temperature,  $V_S$  has a variation of  $500 \text{ mV} \pm 5 \text{ mV}$ . In the basic circuit shown in Figure 19, variations of  $[\pm 5 \times (R1 + R2)/R2] \text{ mV}$  are superimposed on  $V_S$ .

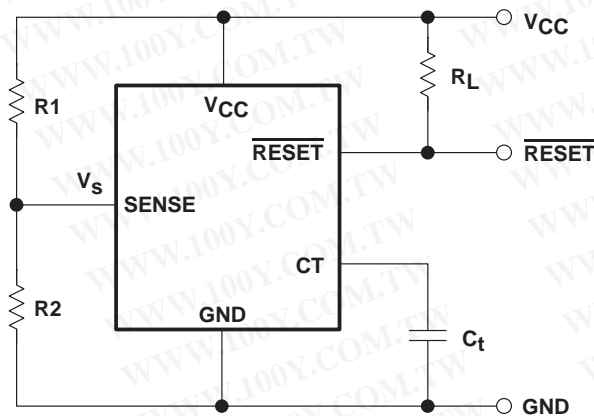

Figure 19

### sense-voltage hysteresis setting

If the sense voltage,  $V_S$ , does not have hysteresis in it and the voltage on the sensing line contains ripples, the resetting of TL7700 will be unstable. Hysteresis is added to the sense voltage to prevent such problems. As shown in Figure 20, the hysteresis,  $V_{hys}$ , is added, and the value is determined as:

$$V_{hys} = I_S \times R1$$

Where:

$$I_S = 2.5 \mu A, \text{ typically at } T_A = 25^\circ C$$

At room temperature,  $I_S$  has variations of  $2.5 \mu A \pm 0.5 \mu A$ . Therefore, in the circuit shown in Figure 19,  $V_{hys}$  has variations of  $(\pm 0.5 \times R1) \mu V$ . In circuit design, it is necessary to consider the voltage-dividing resistor tolerance and temperature coefficient in addition to variations in  $V_S$  and  $V_{hys}$ .

Figure 20.  $V_{CC}$ -RESET Timing Chart

### output pulse-duration setting

Constant-current charging starts on the timing capacitor when the sensing-line voltage reaches the TL7700 sense voltage. When the capacitor voltage exceeds the threshold level of the output drive comparator,  $\overline{RESET}$  changes from a low to a high level. The output pulse duration is the time between the point when the sense-pin voltage exceeds the threshold level and the point when the  $\overline{RESET}$  output changes from a low level to a high level. When the TL7700 is used for system power-on reset, the output pulse duration,  $t_{po}$ , must be set longer than the power rise time. The value of  $t_{po}$  is:

$$t_{po} = C_t \times 10^5 \text{ seconds}$$

Where:

$C_t$  is the timing capacitor in farads

There is a limit on the device response speed. Even if  $C_t = 0$ ,  $t_{po}$  is not 0, but approximately 5  $\mu s$  to 10  $\mu s$ . Therefore, when the TL7700 is used as a comparator with hysteresis, without connecting  $C_t$ , switching speeds ( $t_r/t_f$ ,  $t_{po}/t_{pd}$ , etc.) must be considered.
